Summary about the guidelines' objectives and background, as well as how to use and navigate the guidelines.

Additional content can be found here, as well as a list of internal and external references.

About the guidelines

Due to the rapidly growing youth population, especially in Africa, the creation of jobs has become a major objective in development cooperation. Especially in rural areas, youth lack prospects for productive full-time employment. This guidelines respond to the increasing importance to measure and communicate employment effects of development policy interventions in rural and agricultural development.

GOAL:

The guidelines help rural and agricultural development projects, which do not explicitly target employment effects, to identify implicit employment effects which contribute to the different sets of aggregated indicators within GIZ and BMZ. The guidelines aim to:

- Create links between project activities and potential (implicit) direct employment effects (results logic).
- Guide projects to the most appropriate method to measure and/or estimate employment effects based on their existing resources.

APPROACH:

This document utilises a user-friendly approach basing its content on some of the key findings from a portfolio analysis (see Background Study).

It is an interactive guide designed to help, not only establish a results logic between project activities and employment effects, but also determine which approach is most suitable to measure or estimate employment effects based on a project's available data.

It is important to bear in mind that these guidelines focus on measurable employment effects. There might be more but these may not be assessable in quantitative terms.

BACKGROUND STUDY:

The guidelines are based on a final report from a portfolio analysis conducted in 2018 by the RWI (*Leibniz-Institut für Wirtschaftsforschung*) on 94 GIZ agricultural and rural development projects in sub-Saharan Africa and the MENA region. Its aim was to identify employment effects (explicit/implicit) in project activities and relevant employment indicators – and the intermediate (employment) result (output or outcome level of a project) linked or potentially linkable to them. For more information, [click to see report](#).

TARGET USER:

- Project advisors
- M&E advisors
- Project planning officers of the sectoral department (FMB)

Overview: how to navigate through the guidelines

This document is designed to provide agricultural and rural development projects with guidelines to determine a suitable results logic identifying (implicit) employment effects derived from the project's activities. Furthermore, it offers possible ways to measure or estimate these employment effects. This is done by applying three steps which, briefly summarised, are:

- Step 1: Running projects may classify their main activities into one or more **activity cluster**. In project planning the different clusters allow to think through alternatives;
- Step 2: Based on your selected activity clusters, the guidelines visualize a **results logic** from project activity to an employment effect;
- Step 3: The results logic guides you to a **method map**, that helps determine a method to measure or estimate the employment effects of your project.

However, before moving on to defining the used approach in the guidelines, it is important to first take a closer look at some of the concepts mentioned in the individual steps. Below a short description:

Activity clusters (AC): a total of eight categories deriving from the portfolio analysis in which you can classify your project activities.

Results logic: a graphic that helps visualise and establish the potential link between your activity and the employment effects.

Here, you also see the possible intermediate (employment) results (output or outcome level of a project) between your activities and the employment effects. They are called here intermediate (employment) results as they are intermediary in the results logic from the perspective of the employment effect as the ultimate objective. From there you see which Method Map is applicable.

Method map (MM): a methodological suggestion to help you assess your project's needs and resources, and based on these what is the most suitable approach to measure or estimate. At the end, **you will have to assess, adapt and decide what is most suitable and feasible for your project.**

Note: all method maps can be equally applied to measuring or estimating **gender- or youth-**

specific employment effects, both of which are often of specific interest or constitute the key objective of a given intervention in the rural and agricultural context. The methods suggested in the guidelines do generally not depend on which beneficiary group is targeted. The only practical requirement would be to collect gender- and youth disaggregated data, and that sample sizes may need to be larger.

The next pages provide further information about the activity clusters, results logic and method map structure. [Click here](#) to read more about the different concepts before starting with the guidelines.

Activity clusters

The eight activity clusters (AC) represent typical reoccurring activities from different project types of rural and agricultural development interventions. Within each AC, project activities share typical ways of being connected with employment effects. Please find more information about the different sets of aggregated indicators to describe employment effects in chapter → Context and indicators

It is important to note that these AC are not based on typical project intervention types of rural and agricultural development projects, but on frequently recurring activities across these project types.

Therefore, the objective of the AC, as well as their corresponding visualization seen later on, is to make possible employment effects visible. Because only if a results logic leading to an employment effect (potentially through an intermediate (employment) result) is identified clearly, can an actual methodological assessment of the effect be possible.

Remember: The activity clusters **only focus** on those activities that have a potentially measurable link with an employment effect. In practice this means that the AC cannot comprise all of the activities that any rural development project carries out, but only those activities that have potential connections to employment. See example.

Furthermore, projects usually work in different ACs and often these complement each other to create impacts at the target group level. Projects can prioritize the most important AC or apply various. Often in the data collection, these can then be combined.

Example

A food security project, which focuses on a) advising young mothers on sufficient calorie intake and nutritious diet and b) on product diversification by introducing diversified production cultures to the farmers they work with, will only find the activity of product diversification depicted in the eight activity clusters and not the consultation on calorie intake.

This is the case because product diversification has (over the additional revenue it creates for the farmers) a linkage to the employment dimensions, i.e. income increase for the farmers that diversify their production, while nutrition consultation has no directly measurable or estimable connection to employment.

Activity cluster description

ACTIVITY CLUSTER 1

EDUCATION AND VOCATIONAL TRAINING

Foster and transfer knowledge and skills through continuous education and vocational training in specific areas.

ACTIVITY CLUSTER 2

VALUE CHAIN INTEGRATION

Enhance value chain integration through improved cooperation and business relationships.

ACTIVITY CLUSTER 3

PROMOTION OF PRODUCTION AND INNOVATION

Value chain promotion by focusing on production and productivity, as well as through innovations/ technologies.

ACTIVITY CLUSTER 4

PRODUCT DIVERSIFICATION

Adding new products to existing range or diversifying production systems, as well as improving home gardens and farms for nutritional purposes

ACTIVITY CLUSTER 5

IMPROVED SALES/ MARKETING STRATEGIES

Improving sales and marketing channels targeting consumers.

ACTIVITY CLUSTER 6

IMPROVEMENT OF FINANCIAL SERVICES

Better access to financial services and resources, as well as improving framework conditions for these services.

ACTIVITY CLUSTER 7

CASH-FOR-WORK MEASURES

Use of short-term measures to provide temporary employment in public infrastructure projects.

ACTIVITY CLUSTER 8

LAND RIGHTS/ LAND USE

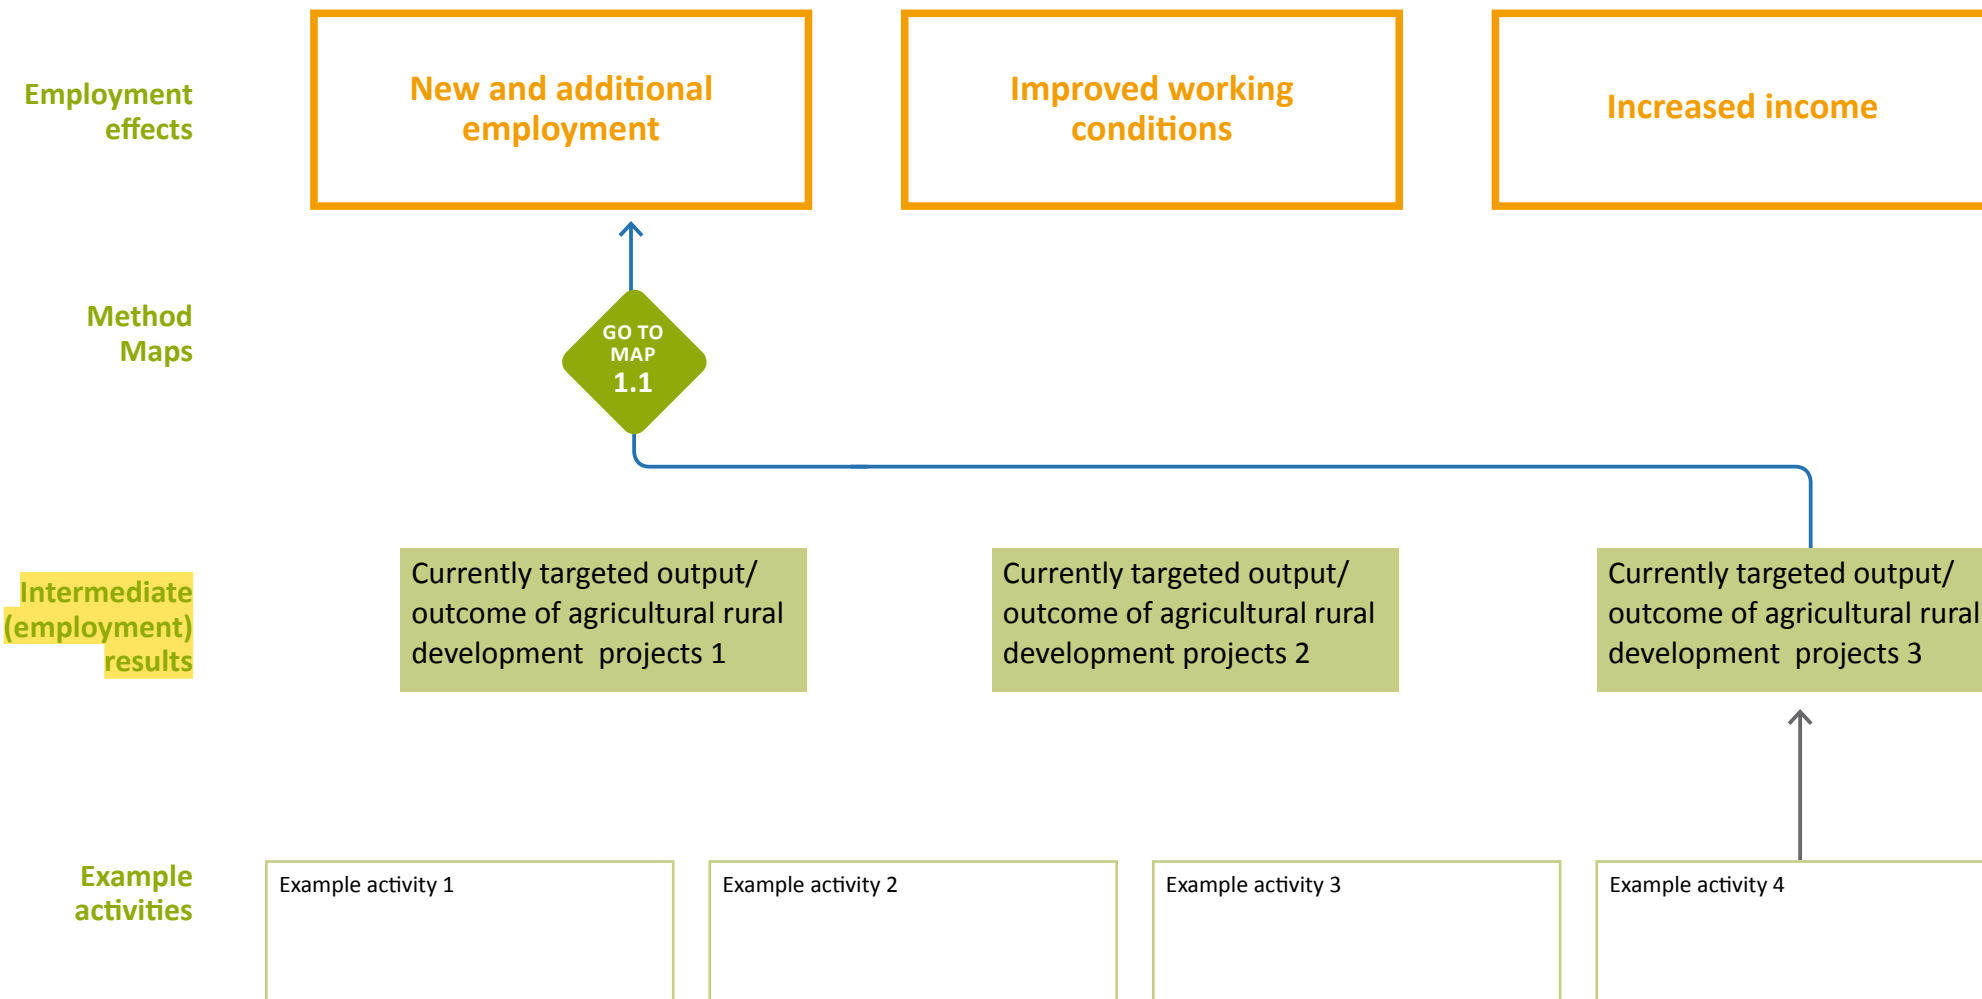

Improve framework conditions for land rights and use, as well as enhance accessibility to land rights.

Example results logic structure

Method map structure

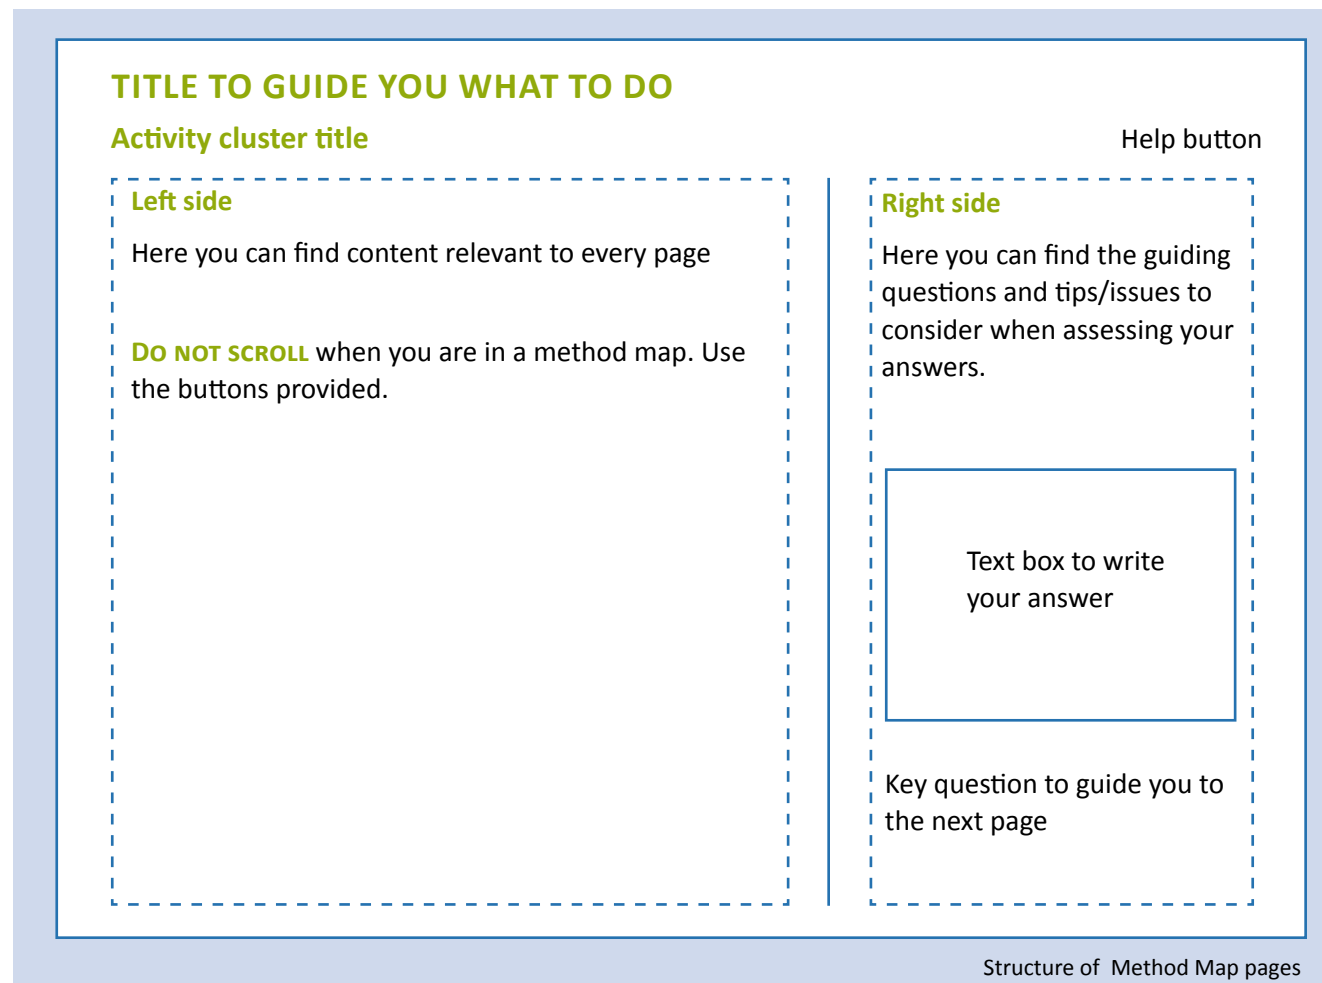

A method map is composed of 6 parts which help assess your project activities' employment effects by looking at:

- Results logic
- Data needed
- Data collection methods
- Measurement or estimation
- Data analysis

Each of these pages ask guiding questions to reflect on your project's needs and resources, while also showing you potential ideas and approaches to consider. To the right side, there are text boxes to write down your specific answers. These will be presented as your individual conclusions in the summary page. At the end of each page you have to make a decision, which will guide you through the document to create your personalised method map.

- Summary

The last page serves as a one-page overview of all your choices. **It is recommended to write down your ideas and choices into the provided text boxes.**

Employment and its effects in rural areas

EMPLOYMENT SITUATIONS IN RURAL AREAS

The employment effects (new and additional employment, increased work quality, increased income) reflect the **typical labor market characteristics in rural areas** to measure meaningful results. These features of labor markets translate into specific employment situations typically observed in rural contexts:

- Underemployment rather than unemployment,
- Predominance of self-employment (i.e. MSME) and own-account work,
- Simultaneous, multiple income-generating activities (off/on-farm),
- Staggered, short term, seasonal own-account work,
- Community- and family (unpaid) labor sharing (non-market work),
- Gap between aspirations vs. existing work opportunities – especially for youth (e.g. blue/white-collar vs. low-quality, seasonal farm job),
- Frequent reallocation or switch between income-generating activities, dependent on availability and pay.

DIRECT, INDIRECT AND INDUCED EMPLOYMENT EFFECTS

- Direct effects are changes among the beneficiaries of the project, regardless of whether these beneficiaries were reached directly by GIZ or via service providers or partner organisations, provided they were reached as part of a project intervention.
- Indirect effects are changes at the level of the project's target population while induced effects are changes beyond the target population. Both cannot be directly attributed to the project intervention, but are the result of the direct effects on beneficiaries.

Indirect effect example

Induced effect example

A PERSON IS CONSIDERED TO BE EMPLOYED IF HE OR SHE IS:

- 15-years-old or older,
- Informally and/or formally active,
- Dependent, self-employed or engaged in family business,
- Produces goods and/or services,
- Generates income and/or benefits in kind through his/her employment(s).

Source: GIZ Results Data 2020

THE FOCUS OF THIS DOCUMENT IS TO HELP IDENTIFY DIRECT EMPLOYMENT EFFECTS

For more information, please see [GIZ's Monitoring of Employment Effects: Workbook for Practitioners, GIZ Results Data 2020, BMZ 2030 Standard Indicators and SEWOH Bilanzindikatoren](#)

Sets of aggregated indicators

The presentation of **quantifiable impacts** of development cooperation is of great importance for public commissioners, especially the BMZ.

Today, several **different sets of aggregated indicators exist**. These collate results across a group of projects, e.g. projects within one special initiative.

The focus of this guidelines is on the following **three sets of indicators**, looking only on indicators related to employment.

Federal Ministry
for Economic Cooperation
and Development

BMZ 2030 STANDARD INDICATORS

- Provide quantitative information on selected and particularly relevant fields of importance for political communication
- Meet the core requirements of "political relevance", "collectability at reasonable cost", "aggregatability", "covering as many projects as possible" (a total of 43 indicators)
- Not part of the results matrix, but as a further annex to the module proposal
- Compulsory for new and follow-up projects. Ongoing projects report on a smaller selection of indicators.
- Standard indicators replace GIZ results data.
- Please note that the guidelines do not replace the official Indicator Definitions Sheets for the BMZ 2030 standard indicators.

[Source](#)

SEWOH /

Federal Ministry
for Economic Cooperation
and Development

SEWOH AGGREGATED INDICATORS

- Provide quantitative information on achieved and aspired successes
- All SEWOH projects are requested to contribute to a set of 11 indicators in 9 topics
- Used by BMZ to communication to the public on SEWOH
- Not used for portfolio or project management
- The development has been based on indicators of GIZ results data

[Source](#)

giz

Deutsche Gesellschaft
für Internationale
Zusammenarbeit (GIZ) GmbH

Federal Ministry
for Economic Cooperation
and Development

GIZ RESULTS DATA/AGGREGATED REPORTING ON RESULTS

- Used by GIZ for communication with the general public
- All GIZ projects are requested to contribute annually to a set of 29 indicators in 10 sectors
- Indicators only provide absolute figures, are not comparative values and do not measure sustainability
- Each indicator has its own core statement on how to formulate results
- Since 2017, aggregated reporting on results by BMZ: documenting performance of official development cooperation (GIZ and KfW) in the form of verifiable and robust quantitative results
- At GIZ, these joint annual aggregated reports are built on aggregate results data (21 of the 29 aggregate indicators)

[Source](#)

How these guidelines refer to employment effects

Even with some minor differences in the indicator formulation, all the existing sets of indicators follow a common general logic. Thus with the following generalized structure, the

methodology of the guidelines can be linked equally to all three sets of indicators. In this guideline, the derivation path for new and additional employment is basically the same.

It only differs in the operationalisation of the measurement. To simplify the presentation of the handout, they are included together in one category.

In the following, the guidelines will refer to the overarching quantitative and qualitative employment effects.

Guidelines

Three steps to assess your employment effects

Click START to begin with the three steps

From now on, **DO NOT SCROLL** and use only the buttons provided

Hover over this button for help and instructions

STEP 1 Determine activity cluster(s)

GUIDING QUESTIONS

Using these guiding questions, classify your intervention activities into the eight activity clusters which are most relevant for potential employment effects.

Remember, one project can be active in more than one AC and they can complement each other and can (most likely) be "integrated" again at indicator level and in the data collection

- **In which activity cluster does my project work?**
- **Which are most relevant for potential employment effects?**
- **Which AC might complement each other?**

Once you have done this, click on the relevant activity cluster in order to be taken to the respective results logic where you can establish the potential linkage to the employment effects

If unsure,

- ➔ [see example how a project categorises its activities](#)

ACTIVITY CLUSTER 1

EDUCATION AND VOCATIONAL TRAINING ➔

ACTIVITY CLUSTER 2

VALUE CHAIN INTEGRATION ➔

ACTIVITY CLUSTER 3

PROMOTION OF PRODUCTION AND INNOVATION ➔

ACTIVITY CLUSTER 4

PRODUCT DIVERSIFICATION ➔

ACTIVITY CLUSTER 5

IMPROVED SALES/ MARKETING STRATEGIES ➔

ACTIVITY CLUSTER 6

IMPROVEMENT OF FINANCIAL SERVICES ➔

ACTIVITY CLUSTER 7

CASH-FOR-WORK MEASURES ➔

ACTIVITY CLUSTER 8

LAND RIGHTS/LAND USE ➔

STEP 1 Determine activity cluster(s): example

TEA VALUE CHAIN PROJECT ACTIVITIES

AC1 Education and Vocational training

- Education: some little literacy training
- Vocational training: modifying tea training institute

AC2 Value chain integration

- Getting tea buyers, traders and producers on one table
- Promoting farmer organizations and workers unions

AC3 Promotion of production and innovation

- Better farming and entrepreneurship building through FFS and FBS leading to yield increase

AC4 Product diversification

- Diversification into cassava cultivation, kitchen gardening

AC5 Improved sales/marketing strategies

- FBS for farmers

AC6 Improvement of financial services

- No activities

AC7 Cash-for-works measures

AC8 Land use/land rights

The project has interventions that can be classified in various AC, for instance in the case of FBS (farmer business school) it is found in AC3 and AC5.

The project decides to pursue AC3 because it has the highest relevance as they have more accurate data collected.

STEP

3 Define your results logic

3.1 Education and vocational training/Improved employability/New and additional employment

RESULTS LOGIC

DESCRIPTION

Application of acquired competencies, improved general skills and the ability to transfer knowledge to others can improve a beneficiarie’s employability (i.e. better skill set needed for relevant job, getting hired sooner, etc.), which can lead to new and/or additional employment.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermerdiate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

➔ SELECT YOUR CHOSEN PRELIMINARY INTERMEDIATE RESULT

STEP 3 Define the data you need

3.2 Education and vocational training/Improved skills/Improved employability/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Measure for improved skills, i.e. survey of beneficiaries or employers or standardized test

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

3.2 Education and vocational training/Competencies application/Improved employability/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Monitoring usage of learned and applied competencies i.e through survey

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

3.2 Education and vocational training/Transfer ability/Improved employability/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Measure of ability to **transfer knowledge**, i.e. through survey

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Education and vocational training/Improved skills/Improved employability/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Education and vocational training/Competencies application/Improved employability/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

STEP 3 Define suitability of data to measure or estimate

.4 Education and vocational training/Improved skills/Improved employability/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define suitability of data to measure or estimate

.4 Education and vocational training/Competencies application/Improved employability/New and additional employment

SELECT TO READ ABOUT

- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Improved skills/Improved employability/New and additional employment

MEASURE

Example: Measuring gross creation of new employment

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The

results logic is that participants will improve their skills, which are relevant to the job market, and, therefore, also their employability. As a result, people are more easily able to come into new employment.

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who have completed the trainings and have obtained a job	50%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$1,800 * 50\% =$ 900 new jobs created

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Competencies application/Improved employability/New and additional employment

MEASURE

Example: Measuring gross creation of new employment

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The

results logic is that participants will acquire new competencies and therefore also improve their employability. As a result, people are more easily able to come into new employment.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who have completed the trainings and have obtained a job	50%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$1,800 * 50\% =$ 900 new jobs created

STEP 3 Define the data analysis to evaluate effects

3.4 Education and vocational training/Transfer ability/Improved employability/New and additional employment

MEASURE

Example: Measuring gross creation of new employment

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The

results logic is that smallholder farmers can transfer their knowledge to their family members who can then work on the same farm, improving not only their own employability but also of

their family members. As a result, people are more easily able to come into new employment.

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who have completed the trainings and have obtained a job	50%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$600 * 50\% =$ 900 new jobs created
Number of beneficiaries who have completed the trainings and shared their new knowledge	6%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$1,800 * 6\% = 108$
Average number of people who began working on the farm (who before did not) after knowledge transfer	1: Retrieved from an annual tracer survey. Beneficiaries were asked how many people began working on the farm after they shared their new knowledge	$108 * 1 = 108$ additional jobs $900+108 =$ 1,008 new jobs created

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Improved skills/Improved employability/New and additional employment

ESTIMATE

Example: Estimating creation of additional employment through spot check

A project focusing on climate-adapted agricultural practices for small-scale farmers conducts trainings on Conservation Agriculture (CA). The results logic is that their skills improved and are applied at their farms, which would improve their employability,

resulting in additional labor for beneficiaries.

The project is unable to measure effects as it did not collect any baseline data regarding the beneficiaries' employment situation, so it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Beneficiaries trained in conservation agriculture	Project's M&E system	1,000
Number of beneficiaries adopting training content	80%: Retrieved from a representative survey (n=278) 3 months after the training [this is a measure]	$1,000 * 80\% = 800$
Number of beneficiaries who said they realized additional income through the additional labor investment for application of CA	80%: Retrieved from a non-representative survey conducted 6 months ago on 30 beneficiaries	$800 * 80\% =$ 640 beneficiaries have potentially increased their employment

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Competencies application/Improved employability/New and additional employment

ESTIMATE

Example: Estimating creation of additional employment through spot check

A project focusing on climate-adapted agricultural practices for small-scale farmers conducts trainings on Conservation Agriculture (CA). The results logic is that competencies are improved and applied at their farms, which would improve their

employability, resulting in additional labor for beneficiaries.

The project is unable to measure effects as it did not collect any baseline data regarding the beneficiaries' employment situation, so it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries trains in CA	Project's M&E system	1,000
Number of beneficiaries adopting training content	80%: Retrieved from a representative survey (n=278) 3 months after the training [this is a measure]	$1,000 * 80\% = 800$
Number of beneficiaries who said they realized additional income through the additional labor investment for application of CA	80%: Retrieved from a non-representative survey conducted 6 months ago on 30 beneficiaries	$800 * 80\% =$ 640 beneficiaries have potentially increased their employment

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Transfer ability/Improved employability/New and additional employment

ESTIMATE

Example: Estimating creation of additional employment through spot check and reference value

A project focusing on climate-adapted agricultural practices for small-scale farmers conducts trainings on Conservation Agriculture (CA). The results logic

is that their skills improved and are applied at their farms, which would improve their employability, resulting in additional labor for beneficiaries.

The project is unable to measure effects as it did not collect any baseline data regarding the beneficiaries' employment situation, so it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries trained in CA	Project's M&E system	1,000
Number of beneficiaries who have passed their new knowledge to other members of their household	34%: Retrieved from a representative survey (n=278) 3 months after the training [this is a measure]	$1,000 * 34\% = 340$
Number of beneficiaries who said they realized additional income after additional labor investment for application of CA	55%: Retrieved from a series of focus groups discussions conducted with 50 beneficiaries	$340 * 55\% = 187$
Average number of household size in the beneficiaries' country	5: Retrieved from national statistics	$187 * 5 =$ 935 people have potentially increased their employment

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Education and vocational training/Improved skills/Improved employability/New and additional employment

METHOD MAP 1.1 SUMMARY PAGE

New and additional employment

STEP 3 Summary: your approach to evaluate employment effects

.5 Education and vocational training/Competencies application/Improved employability/New and additional employment

METHOD MAP 1.1 SUMMARY PAGE

New and additional employment

STEP 3 Summary: your approach to evaluate employment effects

.5 Education and vocational training/Transfer ability/Improved employability/New and additional employment

METHOD MAP 1.1 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

.6 Education and vocational training/Improved employability/New and additional employment

You have completed all the steps in this method map. Choose what you want to do next:

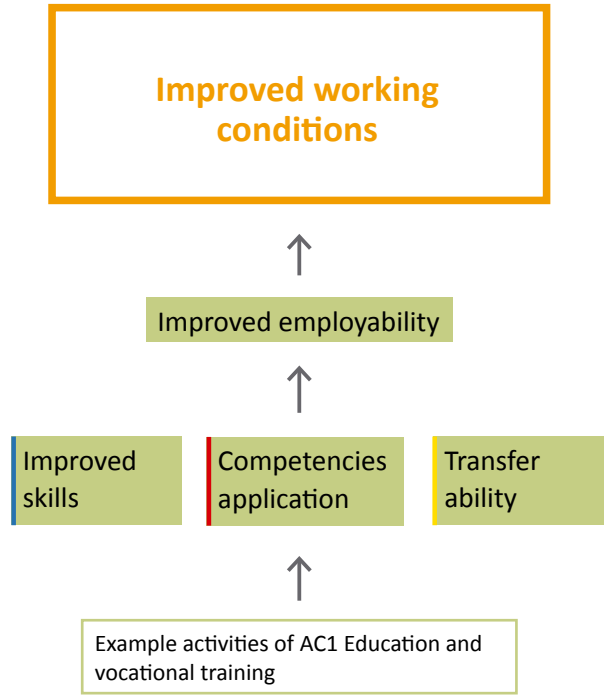

- Return to the first page of the method map to evaluate other intermediate (employment) results.
- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP

3 Define your results logic

.1 Education and vocational training/Improved employability/Improved working conditions

RESULTS LOGIC

DESCRIPTION

Application of acquired competencies, improved general skills and the ability to transfer knowledge to others can improve a beneficiarie’s employability (i.e. better skill set needed for relevant job, getting hired sooner, etc.), which can lead job security and adequate earnings for instance, resulting in improved working conditions.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermerdiate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

➔ SELECT YOUR CHOSEN PRELIMINARY INTERMEDIATE RESULT

STEP 3 Define the data you need

3.2 Education and vocational training/Improved skills/Improved employability/Improved working conditions

THESE DATA ARE NEEDED TO REPORT ON IMPROVED WORKING CONDITIONS

Data needed based on the specific intermediate (employment) result

- Measure for improved skills, i.e. survey of beneficiaries or employers or standardized test

Data needed to calculate employment effects (see [here for more details](#))

- Share with improved working conditions before and after intervention
- Number of beneficiaries

Remember, your project will also have to collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

.2 Education and vocational training/Competencies application/Improved employability/Improved working conditions

THESE DATA ARE NEEDED TO REPORT ON IMPROVED WORKING CONDITIONS

Data needed based on the specific intermediate (employment) result

- Monitoring usage of learned and applied competencies i.e through survey

Data needed to calculate employment effects (see [here](#) for more details)

- Share with improved working conditions before and after intervention
- Number of beneficiaries

Remember, your project will also have to collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

3.2 Education and vocational training/Transfer ability/Improved employability/Improved working conditions

THESE DATA ARE NEEDED TO REPORT ON IMPROVED WORKING CONDITIONS

Data needed based on the specific intermediate (employment) result

- Measure of ability to transfer knowledge, i.e. through survey

Data needed to calculate employment effects (see [here](#) for more details)

- Share with improved working conditions before and after intervention
- Number of beneficiaries

Remember, your project will also have to collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Education and vocational training/Improved skills/Improved employability/Improved working conditions

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Education and vocational training/Competencies application/Improved employability/Improved working conditions

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Education and vocational training/Improved skills/Improved employability/Improved working conditions

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define suitability of data to measure or estimate

.4 Education and vocational training/Competencies application/Improved employability/Improved working conditions

SELECT TO READ ABOUT

- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Improved skills/Improved employability/Improved working conditions

MEASURE

Example: Measuring gross creation of new employment and improved working conditions

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The

results logic is that participants will improve their skills, which are relevant to the job market, and, therefore, also their employability. As a result, people are more easily able to come into new

employment, which could lead to job security, better income, etc, improving working conditions

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who have completed the trainings and have obtained a job	50%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$1,800 * 50\% =$ 900 new jobs created
Number of beneficiaries whose average duration of employment was over 6 months	55%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$900 * 55\% =$ 495 beneficiaries have improved their working conditions

*Note: employment of over 6 months can be seen as an improvement in job stability and security according to ILO

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Competencies application/Improved employability/Improved working conditions

MEASURE

Example: Measuring gross creation of new employment and improved working conditions

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The

results logic is that participants will improve their skills, which are relevant to the job market, and, therefore, also their employability. As a result, people are more easily able to come into new

employment, which could lead to job security, better income, etc, improving working conditions

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who have obtained a job and apply the competencies learned	50%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$1,800 * 50\% =$ 900 new jobs created
Number of beneficiaries whose average duration of employment was over 6 months	55%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$900 * 55\% =$ 495 beneficiaries have improved their working conditions

*Note: employment of over 6 months can be seen as an improvement in job stability and security according to ILO

STEP 3 Define the data analysis to evaluate effects

3.4 Education and vocational training/Transfer ability/Improved employability/Improved working conditions

MEASURE

Example: Measuring improvement of working conditions

A project focusing on improving active labor market policies conducts trainings and workshops for business owners to learn more about management practices, conflict resolution and flexible working hours. The results logic is that business owners can transfer their knowledge to their their employees overall improving working conditions

Derivation steps	Data source/Assumptions	Example calculation
Number of businesses reached in trainings and workshops	Project's M&E system	57
Number of businesses which reported to have implemented flexible working hours	35% : Project's M&E system	$57 * 35\% = 20$
Average number of employees who benefited from flexible working hours	11: Retrieved from an annual tracer survey	$20 * 11 =$ 220 employees benefited from flexible hours
Number of businesses which use conflict resolution tools	42%: Retrieved from an annual tracer survey	$57 * 42\% = 24$
Average number of employees who benefited from conflict resolution tools	8: Retrieved from an annual tracer survey	$24 * 8 =$ 192 employees benefited from conflict resolution tools

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Improved skills/Improved employability/Improved working conditions

ESTIMATE

Example: Estimating creation of additional employment and improvement of working conditions through spot check

A project focusing on climate-adapted agricultural practices for small-scale farmers conducts trainings on Conservation Agriculture. The results logic is that the trainings improve knowledge about safety and equipment use, which leads to

better working conditions.

The project is unable to measure effects as it did not collect any baseline data regarding the beneficiaries' working conditions, and was only able to retrieve some data from a very small non-representative sample:

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	1,000
Number of beneficiaries who indicate they acquired useful knowledge in the training on safety measures and appropriate equipment use	80%: Retrieved from focus group discussions with 20 beneficiaries	$1,000 * 80\% = 800$
Number of beneficiaries who said they had no more or significantly less work related accidents after the training	60%: Retrieved from focus group discussions with 20 beneficiaries	$800 * 60\% =$ 480 beneficiaries have potentially improved their working conditions

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Competencies application/Improved employability/Improved working conditions

ESTIMATE

Example: Estimating creation of additional employment and improvement of working conditions through spot check

A project focusing on climate-adapted agricultural practices for small-scale farmers conducts trainings on Conservation Agriculture. The results logic is that the trainings improve knowledge about safety and equipment use. The application

of these competencies leads to better working conditions.

The project is unable to measure effects as it did not collect any baseline data regarding the beneficiaries' working conditions, and was only able to retrieve some data from a very small non-representative sample:

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	1,000
Number of beneficiaries who believe they have benefited from trainings about safety	80%: Retrieved from focus group discussions with 20 beneficiaries	$1,000 * 80\% = 800$
Number of beneficiaries who said they now have no work-related accidents since the trainings	60%: Retrieved from focus group discussions with 20 beneficiaries	$800 * 60\% =$ 480 beneficiaries have potentially improved their working conditions

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Transfer ability/Improved employability/Improved working conditions

ESTIMATE

Example: Estimating improvement of working conditions using reference values

A project focusing on improving dialogue between employees and supervisors in multiple country, conducts training of trainers to train enterprise supervisors on modern management practices and social skills. The result logic is

that newly trained trainers will transfer knowledge to other beneficiaries, leading to an improvement of working conditions. However, many trainers have not collected adequate data and therefore the project must estimate using reference values:

Derivation steps	Data source/Assumptions	Example calculation
Number of newly trained trainers on modern management practices	Project's M&E system	100
Average number of trainings conducted by new trainers in the first year	22 : Project's M&E system	$100 * 22 = 2,200$
Average number of participants per training	30 (28 employees and their 2 supervisors): reference value taken from another GIZ project that also conducts similar trainings	$2,200 * 30 =$
Number of participants with improved working conditions	60%: share of participants who reported an actual improvement after the training (finding from focus group discussion from a similar project)	$66,000 * 60% =$ 39,600 people have potentially improved their working conditions

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Education and vocational training/Improved skills/Improved employability/Improved working conditions

METHOD MAP 1.2 SUMMARY PAGE

 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3.1 Define your results logic

Education and vocational training/Improved employability/Increased income

RESULTS LOGIC

DESCRIPTION

Application of acquired competencies, improved general skills and the ability to transfer knowledge to others can improve a beneficiarie’s employability (i.e. better skill set needed for relevant job, getting hired sooner, etc.), which can lead to income increase

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermerdiate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

➔ SELECT YOUR CHOSEN PRELIMINARY INTERMEDIATE RESULT

STEP 3 Define the data you need

3.2 Education and vocational training/Improved skills/Improved employability/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Measure for improved skills, i.e. survey of beneficiaries or employers or standardized test

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project will also have to collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

3.2 Education and vocational training/Competencies application/Improved employability/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Monitoring usage of learned and applied competencies i.e through survey

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project will also have to collect these variables for its control groups (if any)

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Improved skills/Improved employability/Increased income

MEASURE

Example: Measuring gross effects for income using before-after analysis

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The

results logic is that participants will improve their skills, which are relevant to the job market, and, therefore, also their employability. As a result, people are more easily able to come into new

employment and will improve their income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who found a job after the training and improved their income	80%: Partner's M&E system	$1,800 * 80\% =$ 1,440 beneficiaries have increased their income
Average weekly income before intervention (local currency unit)	500: Baseline study	$650 - 500 =$
Average weekly income after intervention (local currency unit)	650: Latest annual tracer survey	150 currency units per week increase in income

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Competencies application/Improved employability/Increased income

MEASURE

Example: Measuring gross effects for income using before-after analysis

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships.

The results logic is that participants will apply the newly learned competencies, which are relevant to the job market, and, therefore, also their employability. As a result, people

are more easily able to come into new employment and will improve their income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached who have taken part in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who found a job after the training and improved their income	80%: Partner's M&E system	$1,800 * 80\% =$ 1,440 beneficiaries have increased their income
Average weekly income before intervention (local currency unit)	500: Baseline study	$650 - 500 =$
Average weekly income after intervention (local currency unit)	650: Latest annual tracer survey	150 currency units per week increase in income

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Transfer ability/Improved employability/Increased income

MEASURE

Example: Measuring increased income

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The

results logic is that smallholder farmers can transfer their knowledge to their family members who can then work on the same farm, improving not only their own employability but also of

their family members. As a result, people are more easily able to come into new employment and will improve their income.

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached in trainings to improve their skills	Project's M&E system	3,000
Number of beneficiaries reached who have completed trainings	60%: Partner's M&E system	$3,000 * 60\% = 1,800$
Number of beneficiaries who have improved their income after training	50%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$1,800 * 50\% = 900$
Number of beneficiaries who succeeded increasing their income and shared their new knowledge with others	6%: Retrieved from an annual tracer survey based on a representative sample (n=317)	$1,800 * 6\% = 108$
Average number of people who improved their income through the new gained knowledge	1: Retrieved from an annual tracer survey. Beneficiaries were asked how many people began working on the farm after they shared their new knowledge	$108 * 1 = 108$ additional jobs $900 + 108 =$ 1,008 people increased their income

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Improved skills/Improved employability/Increased income

ESTIMATE

Example: Estimating income increase using spot check

A project focusing on improving active labor market policies conducts trainings to improve job competencies and soft skills, as well as offers internships. The results logic is that participants

will improve their skills, which are relevant to the job market, and, therefore, also their employability. As a result, people are more easily able to come into new employment and will improve their income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries trained	Project's M&E system	1,000
Number of beneficiaries adopting training content	80%: Retrieved from a representative survey (n=278) 3 months after the training [this is a measure]	$1,000 * 80\% = 800$
Number of beneficiaries who have said the training has led to a higher income	80%: Retrieved from a non-representative survey conducted 6 months ago on 30 beneficiaries	$800 * 80\% =$ 640 beneficiaries have potentially increased their income

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Competencies application/Improved employability/Increased income

ESTIMATE

Example: Estimating increased income

A project focusing on climate-adapted agricultural practices for small-scale farmers conducts trainings on Conservation Agriculture. The results logic is that competencies are improved and applied at their farms, which would improve their employability.

As a result, people are more easily able to come into new employment and will improve their income. The project is unable to measure effects as it did not collect any baseline data regarding the beneficiaries' employment situation, so it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached in trainings	Project's M&E system	1,000
Number of beneficiaries adopting training content	80%: Retrieved from a representative survey (n=278) 3 months after the training [this is a measure]	$1,000 * 80\% = 800$
Number of beneficiaries who said they realized additional income through the additional labor investment for application of training content	80%: Retrieved from a non-representative survey conducted 6 months ago on 30 beneficiaries	$800 * 80\% =$ 640 beneficiaries have potentially increased their income

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Education and vocational training/Transfer ability/Improved employability/Increased income

ESTIMATE

Example: Estimating creation of additional employment through spot check and reference value

A project focusing on climate-adapted agricultural practices for small-scale farmers conducts trainings on Conservation Agriculture. The results logic is that beneficiaries may share their

newly learned knowledge with others at their farm, which would improve their employability and yield productivity, leading to an increase in income.

The project is unable to measure effects as it did not collect any baseline data

regarding the beneficiaries' employment situation, so it will have to estimate:

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached in trainings	Project's M&E system	1,000
Number of beneficiaries who have passed their new knowledge to people on the farm	34%: Retrieved from a representative survey (n=278) 3 months after the training [this is a measure]	$1,000 * 34\% = 340$
Number of people with passed on knowledge working more hours to implement what they learned, who thus realize an income increase	55%: Retrieved from a series of focus groups discussions conducted with 50 beneficiaries	$340 * 55\% = 187$
Average number of persons working together on one small scale farm	5: Retrieved from national statistics	$187 * 5 =$ 935 people have potentially increased their income

STEP 3 Summary: your approach to evaluate employment effects

METHOD MAP 1.3 SUMMARY PAGE

Increased income

STEP 3 Next steps

.6 Education and vocational training/Improved employability/Increased income

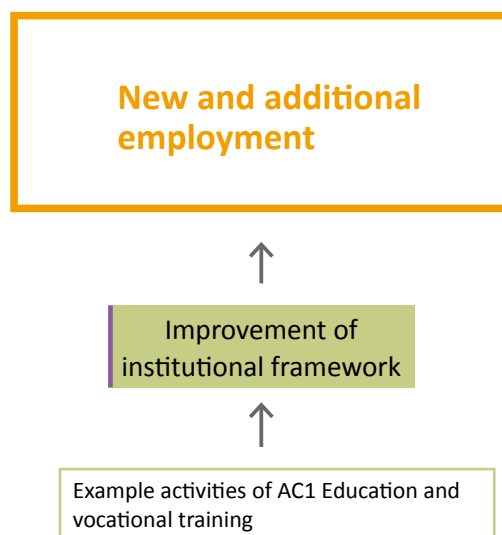

You have completed all the steps in this method map. Choose what you want to do next:

- Return to the first page of the method map to evaluate other intermediate (employment) results.
- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

3.1 Education and vocational training/Improved Institutional Framework/New and additional employment

RESULTS LOGIC

DESCRIPTION

Changes in the regulatory framework facilitate job creation or job finding (e.g. through de-regulation or improved job matching) and job characteristics. This mechanism concerns global framework changes (i.e. typically at the national/government or other superordinate level).

BEAR IN MIND...

Overarching advisory activities and global (i.e. national level) institutional changes are difficult to assess through measurement, therefore the **most suitable approach is to estimate** using a descriptive analytical method, which makes plausible each step/assumption in the results logic using primary and secondary data.

Therefore Method Map 1.4 focuses on providing a comprehensive range of data collection methods in order to help you conduct a descriptive analysis. Only estimation approaches will be shown.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

STEP 3 Define the data you need

3.2 Education and vocational training/Improved Institutional Framework/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Monitoring requirements

- Number of trained ministry officials
- Number of implemented regulations/reforms
- Monitor changes in regulations
- etc.

Bear in mind...

As previously said, the **most suitable approach is to estimate** the potential employment effects using a descriptive analytical method. This means you need to justify each step in the results logic.

For instance, monitoring would need to collect data of the step-by-step approach in the results logic: (i) prove that output was attained (number of ministry officials trained), (ii) prove that outcomes were affected (number of regulations implemented), (iii) combine with labor market data on connectable indicators: job growth in the economy, or number of new businesses registered, etc.

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

DEFINE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Education and vocational training/Improved Institutional Framework/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP

3 Define the data collection methods

3.3 Education and vocational training/Improved Institutional Framework/New and additional employment

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Education and vocational training/Improved Institutional Framework/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

GO TO THE NEXT PAGE TO DEFINE YOUR APPROACH

STEP 3 Define the data analysis to evaluate effects

3.4 Education and vocational training/Improved Institutional Framework/New and additional employment

ESTIMATE

Example: Estimating new employment

A project aims at implementing nation-wide sustainable ATVET structures and processes for the agricultural sector. It develops, in accordance with the lead institutions such as the ministry, vocational training curricula that are implemented in all educational facilities in the sector.

The results logic is that through advisory services there is an improvement in the institutional framework in regards to education and this will then spillover to its citizens, leading to an improvement in new/additional employment as better trainings are offered improving people's employability and competencies.

Overarching advisory activities and global (i.e. national level) institutional changes are difficult to assess through measurement.

An estimation approach usually means you break down your results logic into steps (from your activity, to intermediate outcome, to indicator) and justify the linkage with your collected data. In this case::

- Monitor and document that the new training curricula are actually devised, i.e looking into local news sources, official ministry communication, updates from NGOs or civil society organisations, etc.
- Document usage of these by, for instance, observing 15 agricultural training facilities to show that the new curricula are known and put into practice. Note: Observation is also a qualitative data collection method. For more information, see references in Resources.
- Working meetings between ministry officials and heads of the schools etc. could be monitored to prove the link (number of meetings, results and so on.).

Then an estimation could look as follows: Given that there is monitoring evidence that (i) the curricula were actually put in place

[new law and regulation formulated] in (ii) a sufficiently large number of training facilities [the 15 report accordingly] and (iii) students and teachers confirm the changed curricula: suppose 100,000 target students (according to Ministry of Education data) are in the relevant training system in one cohort (year). The new curricula improved their educational attainment, increasing employability by 5% (based graduation tests in a sample of students/schools), then the effect on “new employment” could be estimated as 5,000 individuals, assuming that the employability effect directly translates into an employment effect. Additional evidence making plausible this approach could be drawn from firm surveys, if employers report that trainees are better qualified with the new framework.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Education and vocational training/Improved Institutional Framework/New and additional employment

3.2 Value chain integration/Revenue and sales/Improved cooperation/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of business partners, number of business transaction, etc
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

3.2 Value chain integration/Value creation/Improved cooperation/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of business partners, number of business transaction, etc
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

3.2 Value chain integration/New business models/Improved cooperation/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of business partners, number of business transaction, etc
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

.2 Value chain integration/Access to market/Improved cooperation/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of business partners, number of business transaction, etc
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Value chain integration/Revenue and sales/Improved cooperation/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Value chain integration/Value creation/Improved cooperation/New and additional employment

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Value chain integration/Revenue and sales/Improved cooperation/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define suitability of data to measure or estimate

.4 Value chain integration/Value creation/Improved cooperation/New and additional employment

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

3.4 Value chain integration/Revenue and sales/Improved cooperation/New and additional employment

MEASURE

Example: Measuring creation of new employment despite non-representative sample

A project focused on promoting broad-based business models and operational improvements (new processing methods; better marketing etc.) aims to improve value generation and to integrate

new producers into the supported value chains.

The results-logic is that cooperation along the value chain is also enhanced. As a result, this will contribute to the creation of new employment

Derivation steps	Data source/Assumptions	Example calculation
Number of MSMEs reached by the intervention	Project's M&E system	10,500
Number of MSMEs that introduced a set of operational improvements	70%: annual survey with a representative sample of 371	$10,500 * 70\% = 7,350$
Average number of new employees	0.2: tracer study with a sample size of 161 (non-representative)	$7,350 * 0.2 =$ 1,470 full-time job equivalents have been created

Note: despite the sample not being representative at 95% coefficient, this calculation can still be considered a measure in reporting if the survey is of high quality

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Value creation/Improved cooperation/New and additional employment

MEASURE

Average number of new employees	0.2: tracer study with a sample size of 161 (non-representative)	$7,350 * 0.2 =$ 1,470 full-time job equivalents have been created

Note: despite the sample not being representative at 95% coefficient, this calculation can still be considered a measure in reporting if the survey is of high quality

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Revenue and sales/Improved cooperation/New and additional employment

ESTIMATE

Example: Estimating creation of additional employment using reference values

A project focused on promoting and establishing new distribution channels for local traders and sellers in a specific value chain.

The results-logic is that through new access to market/sales relationships, cooperation along

the value chain is improved creating additional labor input. Thus, leading to more and/or additional employment.

The project is unable to measure effects as it does not have the necessary resources, so it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of traders reached by intervention	Project's M&E system	25,000
Number of traders that introduced a set of operational improvements	72%: annual survey with a representative sample of 371	$25,000 * 72\% = 18,000$
Reference value for share of adopters who have increased their hours of work	33%: reference value from another project that targets the same type of beneficiaries in a neighbouring country	$18,000 * 33\% =$ 5,940 persons with additional employment

Note: The 5,940 persons did not only increase working hours but also realised income increase.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Value creation/Improved cooperation/New and additional employment

New and additional employment

STEP 3 Summary: your approach to evaluate employment effects

3.5 Value chain integration/**New business models**/Improved cooperation/New and additional employment

METHOD MAP 2.1 SUMMARY PAGE

New and additional employment

STEP 3 Summary: your approach to evaluate employment effects

3.5 Value chain integration/Access to market/Improved cooperation/New and additional employment

METHOD MAP 2.1 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

.6 Value chain integration/Improved cooperation/New and additional employment

You have completed all the steps in this method map. Choose what you want to do next:

- Return to the first page of the method map to evaluate other intermediate (employment) results.
- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Value chain integration/Improved cooperation/Increased income

RESULTS LOGIC

DESCRIPTION

Improved cooperation

Please click to read results-logic

Example activities of AC2 Value chain integration

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

➔ SELECT YOUR CHOSEN PRELIMINARY INTERMEDIATE RESULT

STEP 3 Define the data you need

.2 Value chain integration/Revenue and sales/Improved cooperation/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of business partners, number of business transaction, etc
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Value chain integration/Revenue and sales/Improved cooperation/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define suitability of data to measure or estimate

.4 Value chain integration/Value creation/Improved cooperation/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Revenue and sales/Improved cooperation/Increased income

MEASURE

Example: Measuring gross effects for income increase using before-after analysis

A project focused on promoting broad-based business models and operational improvements (new processing methods; better marketing etc.) aims to increase enterprises' profitability and

improve cooperation. The results-logic is that better sales and higher profits can improve cooperation, potentially increasing income for the MSMEs.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of MSMEs reached by the intervention	Project's M&E system	10,500
Number of MSMEs that reported an increase in sales and profits	77%: survey conducted after project support	$10,500 * 77\% = 8,085$
Number of MSMEs that also reported income increase	89%: from the same survey as above	$8,085 * 89\% =$ 7,195 (89%) of beneficiaries reported an increase in income
Average income in local currency per week before intervention	1,000: baseline data	$1,200 - 1,000 =$ 200 currency units per week in income increase on average
Average income in local currency per week after intervention	1,200: latest tracer survey	

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Value creation/Improved cooperation/Increased income

MEASURE

Example: Measuring gross effects for income increase using before-after analysis

A project focused on promoting broad-based business models and operational improvements (new processing methods; better marketing etc.) to improve value generation and to integrate new

producers into the supported value chains.
The results-logic is that by increasing the value creation, cooperation is improved. This then generates new profits and

revenue, leading potentially to increased income for the MSMEs.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of MSMEs reached by the intervention	Project's M&E system	10,500
Number of MSMEs that introduced a set of operational improvements	77%: survey conducted after project support	$10,500 * 77\% = 8,085$
Number of MSMEs that also reported income increase	89%: from the same survey as above	$8,085 * 89\% =$ 7,195 (89%) of beneficiaries reported an increase in income
Average income in local currency per week before intervention	1,000: baseline data	$1,200 - 1,000 =$ 200 currency units per week in income increase on average
Average income in local currency per week after intervention	1,200: latest tracer survey	

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/New business model/Improved cooperation/Increased income

MEASURE

Example: Measuring gross effects for income increase using before-after analysis

A project focused on promoting broad-based business models and operational improvements (new processing methods; better marketing etc.) to improve value generation and to integrate new

producers into the supported value chains.
The results-logic is that by increasing the value creation, cooperation is improved. This then generates new profits and

revenue, leading potentially to increased income for the MSMEs.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of MSMEs reached by the intervention	Project's M&E system	10,500
Number of MSMEs that introduced a set of operational improvements	77%: survey conducted after project support	$10,500 * 77\% = 8,085$
Number of MSMEs that also reported income increase	89%: from the same survey as above	$8,085 * 89\% =$ 7,195 (89%) of beneficiaries reported an increase in income
Average income in local currency per week before intervention	1,000: baseline data	$1,200 - 1,000 =$ 200 currency units per week in income increase on average
Average income in local currency per week after intervention	1,200: latest tracer survey	

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Access to market/Improved cooperation/Increased income

MEASURE

Example: Measuring gross effects for income increase using before-after analysis

A project focused on promoting broad-based business models and operational improvements (new processing methods; better marketing etc.) to improve value generation and to integrate new

producers into the supported value chains.
The results-logic is that by increasing the value creation, cooperation is improved. This then generates new profits and

revenue, leading potentially to increased income for the MSMEs.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of MSMEs reached by the intervention	Project's M&E system	10,500
Number of MSMEs that introduced a set of operational improvements	77%: survey conducted after project support	$10,500 * 77\% = 8,085$
Number of MSMEs that also reported income increase	89%: from the same survey as above	$8,085 * 89\% =$ 7,195 (89%) of beneficiaries reported an increase in income
Average income in local currency per week before intervention	1,000: baseline data	$1,200 - 1,000 =$ 200 currency units per week in income increase on average
Average income in local currency per week after intervention	1,200: latest tracer survey	

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Revenue and sales/Improved cooperation/Increased income

ESTIMATE

Example: Estimating income increase through reference value

A project focused on promoting broad-based business models and operational improvements (new processing methods; better marketing etc.) to improve value generation and to integrate new producers into the supported

value chains. The results logic is that by increasing the value creation cooperation is improved. This then generates new profits and revenue, leading potentially to increased income for the MSMEs.

The project is unable to measure gross effects as it does not have a baseline data to compare income. Therefore, it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of MSMEs reached by the intervention	Project's M&E system	10,500
Number of MSMEs that have introduced operational improvements	77%: survey conducted after project support with a representative sample of 371 (measure)	$10,500 * 77\% = 8,085$
Number of MSMEs that said their income has increased	80%: survey conducted with 200 beneficiaries from 8,085	$8,085 * 80\% =$ 6,468 beneficiaries reported income increase
Average income in local currency per week after intervention	1,200: survey conducted with 200 beneficiaries from 8,085	$1,200 - 900 =$ 300 currency units per week in income increase on average
Average income in the country in the year before project started	900: World Bank's Living Standards Measurement Study - Integrated Surveys on Agriculture (LSMS-ISA) dataset of household surveys	

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Value chain integration/Value creation/Improved cooperation/Increased income

ESTIMATE

Example: Estimating income increase through reference value

A project focused on promoting broad-based business models and operational improvements (new processing methods; better marketing etc.) to improve value generation and to integrate new producers into the supported

value chains.

The results logic is that by increasing the value creation cooperation is improved. This then generates new profits and revenue, leading potentially to increased income for the MSMEs.

The project is unable to measure gross effects as it does not have a baseline data to compare income. Therefore, it will have to estimate:

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

METHOD MAP 2.2 SUMMARY PAGE

Increased income

STEP 3 Next steps

.6 Value chain integration/Improved cooperation/New and additional employment

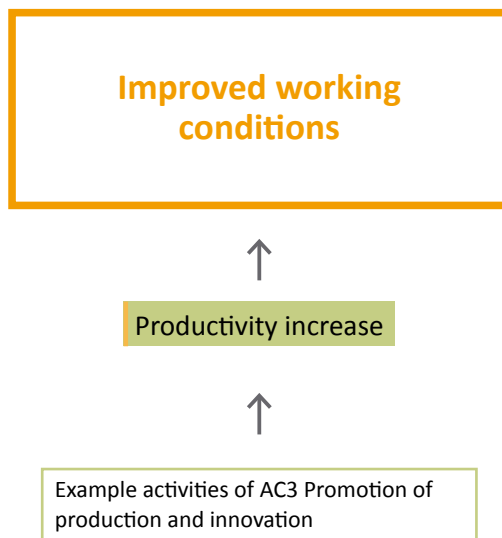

You have completed all the steps in this method map. Choose what you want to do next:

- Return to the first page of the method map to evaluate other intermediate (employment) results.
- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

3.1 Promotion of production and innovation/Productivity increase/Improved working conditions

RESULTS LOGIC

DESCRIPTION

Through an increase in productivity, such as mechanization or improved cultivation system, working conditions are potentially facilitated and improved.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Improved working conditions

STEP 3 Define the data you need

.2 Promotion of production and innovation/Productivity increase/Improved working conditions

THESE DATA ARE NEEDED TO REPORT ON IMPROVED WORKING CONDITIONS

Data needed based on the specific intermediate (employment) result

- Productivity increase (i.e additional production of yields per ha)

Data needed to calculate employment effects (see [here](#) for more details)

- Share with improved working conditions before and after intervention
- Number of beneficiaries

Remember, your project will also have to collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Promotion of production and innovation/Productivity increase/Improved working conditions

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

3.3 Promotion of production and innovation/Productivity increase/Improved working conditions

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Promotion of production and innovation/Productivity increase/Improved working conditions

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

3.4 Promotion of production and innovation/Productivity increase/Improved working conditions

MEASURE

Example: Measuring improved working conditions

A project focuses on enhancing quality in agricultural production to increase income and create jobs along the value chains of citrus, mango and pineapple. One of its activities is to build capacities by providing trainings on hygienic and

effective manufacturing practices. The results logic is that through consultations/trainings, which improve beneficiaries' competencies, there is an increase in productivity. Therefore, work quality and working conditions

are potentially improved as it effects aspects like a safe work environment and labor standards.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of enterprises reached by the intervention	Project's M&E system	25
Number of enterprises that have participated in activities designed to improve working conditions	80%: project's M&E system	$25 * 80\% = 20$
Number of enterprises that have increased productivity	50%: tracer study (complete survey) of these 20 enterprises	$20 * 50\% = 10$ 10 enterprises have improved their working conditions
Average number of employees working per enterprise	8: projects M&E system	$10 * 8 = 80$ 80 people benefited from improved working conditions

STEP 3 Define the data analysis to evaluate effects

.4 Promotion of production and innovation/Productivity increase/Improved working conditions

ESTIMATE

Example: Estimating improved working conditions using secondary data

A project has the objective of sustainably improving smallholder farmers' income and food supply through more diversified agricultural cultivation. It conducts Farmer Business School (FBS) trainings and one of the main learning outcomes for farmers is increasing their incomes

by investing in improved cultivation techniques. This can be considered a measure that improves work quality by providing adequate earnings, employment opportunities or job security.

The results logic is that FBS introduces beneficiaries with sustainable innovations and techniques, which

can increase productivity and, subsequently, improve working conditions.

The project is unable to draw a representative sample of its 500 agribusinesses reached, so it will have to estimate using secondary data.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of agribusinesses reached by the intervention	Project's M&E system	500
Number of beneficiaries applying new methods or measures which improve job security	50%: statistics from a comparative study	$500 * 50\% = 250$
Average number of employees in an agribusiness in the country	4: nationaal statistics from the country's Ministry of Agriculture	$250 * 4 =$ 1,000 people have potentially benefited from improved working conditions

STEP 3 Summary: your approach to evaluate employment effects

.5 Promotion of production and innovation/Productivity increase/Improved working conditions

METHOD MAP 3.1 SUMMARY PAGE

Improved working conditions

STEP 3 Next steps

3.6 Promotion of production and innovation/Productivity increase/Improved working conditions

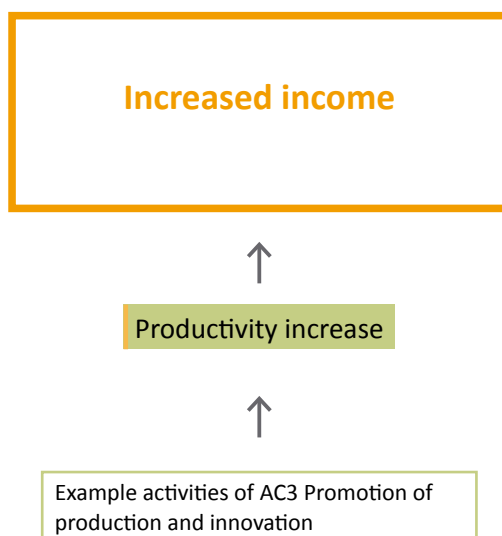

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Promotion of production and innovation/Productivity increase/Increased income

RESULTS LOGIC

DESCRIPTION

Through an increase in productivity – e.g. mechanization, improved cultivation system, innovation – there is higher production which leads to more output, causing an increase in revenue and, therefore, in income.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

.2 Promotion of production and innovation/Productivity increase/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Productivity increase (i.e additional production of yields per ha)

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Promotion of production and innovation/Productivity increase/Increased income

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

3.3 Promotion of production and innovation/Productivity increase/Improved working conditions

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Promotion of production and innovation/Productivity increase/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Promotion of production and innovation/Productivity increase/Increased income

MEASURE

Example: Measuring income increase through before-after analysis

A project with the objective of promoting innovations in the agriculture and the food sector in order to supply food to its four target countries. It provides advisory services on innovations

(fertilisers and food cooling chains) that lead to production and productivity increase.
The results logic is that through its advisory services, beneficiaries can

increase their productivity, as the same input generates more output. This leads to an increase in profits/revenue and, therefore, income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached in one of the countries	Project's M&E system	3,000
Number of beneficiaries that have adopted the promoted innovations	86%= annual farmer survey with a representative sample of 341	$3,000 * 86\% = 2,589$
Number of beneficiaries who also have increased productivity in last 12 months	60%= same annual farmer survey as before	$2,589 * 60\% = 1,548$
Average annual income per smallholder farmer	10,000 local currency units: retrieved from gross margin analysis using data collected on sales and variable costs	$2,589 * 10,000 =$ 25,890,000 in local currency total income increase
Total average income before intervention	20,000,000: baseline study	$25,890,000 - 20,000,000 =$ 5,890,000(29.5%) increase in total annual income since the intervention

STEP 3 Define the data analysis to evaluate effects

.4 Promotion of production and innovation/Productivity increase/Increased income

ESTIMATE

Example: Estimating income increase using reference values

A project aiming to enhance access to high quality seeds and mechanisation through practical trainings in farm machinery operations and cultivation methods that conserve soil fertility.

The results logic is that through the introduction of sustainable cultivation methods and mechanization of agriculture, beneficiaries adopt the promoted measures leading to an increase in productivity. Consequently, improving their income.

The project has no baseline data available and also does not have the resources to draw a representative survey. Therefore, it will have to estimate the potential income effects.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached by the intervention	Project's M&E system	10,000
Number of beneficiaries applying new methods or measures which improve job security	67%: M&E system of implementing partners	10,000*67%= 6,700 beneficiaries have potentially increased their income
Average income increase (%)	3.6%: reference value from other similar GIZ interventions	500*3.6%= 18 local currency units of additional income
Average income of farmers	500 local currency units: UN Database	

STEP 3 Summary: your approach to evaluate employment effects

3.5 Promotion of production and innovation/Productivity increase/Increased income

METHOD MAP 3.2 SUMMARY PAGE

Increased income

STEP 3 Next steps

3.6 Promotion of production and innovation/Productivity increase/Increased income

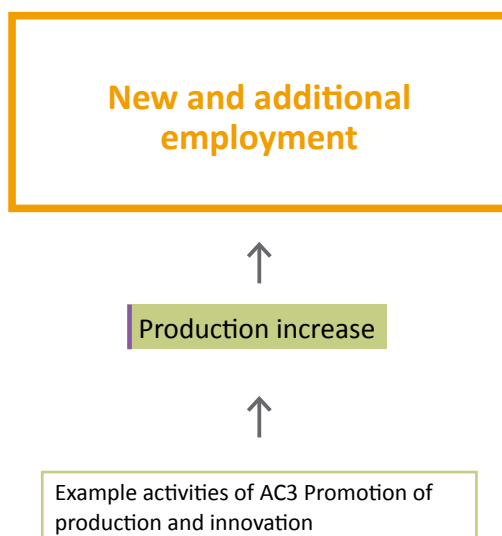

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

3.1 Promotion of production and innovation/Production increase/New and additional employment

RESULTS LOGIC

DESCRIPTION

Through consultations or trainings, beneficiaries improve their competencies and there is higher intensification of production. This creates a higher labor input and, therefore can lead to an increase in new and additional employment.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

STEP 3 Define the data you need

.2 Promotion of production and innovation/Production increase/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Measure production increase, for instance increase in yields or gross margin

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Promotion of production and innovation/Production increase/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP

3 Define the data collection methods

3.3 Promotion of production and innovation/Production increase/New and additional employment

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Promotion of production and innovation/Production increase/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

3.4 Promotion of production and innovation/Production increase/New and additional employment

MEASURE

Example: Measuring additional employment through gross margin analysis

A project focusing on the cocoa value chain conducts GAP trainings with 500 farmers. The project wants to measure its additional employment.

The results logic is that through a training like GAP, there is an increase in production which leads to higher labor demands. As a result, there is an increase in (additional) employment.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached during intervention	Project's M&E system	500
Number of labor days per farmer before intervention	50 local currency units: baseline study	
Number of labor days per farmer after intervention	110 local currency units: gross margin analysis	110-50= 60 additional labor days per ha
GAP adoption rate among beneficiaries	65%: GAP analysis from data collected by project	60 x 1 x 500 x 65% / 225 = 87 additional Full-time equivalent (FTE)
Average farm size in ha	1: baseline study	

Read about [Full-time equivalent \(FTE\)](#)

STEP 3 Define the data analysis to evaluate effects

.4 Promotion of production and innovation/Production increase/New and additional employment

ESTIMATE

Example: Estimating creation of additional employment through non-representative sample

A project has an activity which improves access to input (tools, seed, etc.) and services (mechanization) to small-holder farmers.

The results logic is that through improved access to inputs and

services, there will be an increase in production, leading to higher labor input. Resulting in the creation of new employment.

The project is unable to measure effects as it does not have baseline values, so it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of small-holder farmers reached	Project's M&E system	3,000
Number of beneficiaries who apply inputs/services introduced by the project	83%: project's M&E system	$3,000 * 83\% = 2,490$
Number of beneficiaries who also reported increase in production after additional labor investment for application	66%: project's M&E system	$2,490 * 66\% = 1,643$ 1,643 beneficiaries are estimated to have increased their working hours

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Promotion of production and innovation/Production increase/New and additional employment

METHOD MAP 3.3 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

.6 Promotion of production and innovation/Production increase/New and additional employment

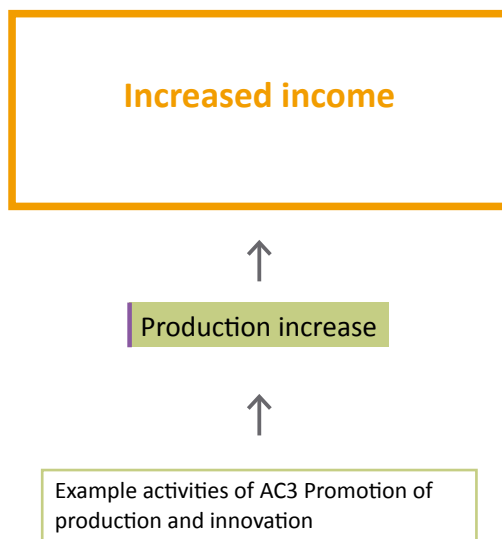

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Promotion of production and innovation/Production increase/Increased income

RESULTS LOGIC

DESCRIPTION

Providing access to inputs or services or using advisory services and trainings, increases production and output which then leads to more revenue and higher income.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

.2 Promotion of production and innovation/Production increase/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Measure production increase, for instance increase in yields or gross margin

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Promotion of production and innovation/Production increase/Increased income

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

3.3 Promotion of production and innovation/Production increase/Increased income

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Promotion of production and innovation/Production increase/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Promotion of production and innovation/Production increase/Increased income

MEASURE

Example: Measuring gross effects in increased/improved (net) income

A programme focusing on the fish value chain operating in 6 countries has an objective of improving access to fish production and curbing illegal and unregulated fishing. It provides

advisory services to micro and small and medium sized artisanal enterprises on sustainable production and processing.

The results logic is that its advisory services introduce the beneficiaries

with innovative methods which increase production and output. More output leads to more revenue and, thus, improves income.

Derivation steps	Data source/Assumptions	Example calculation
Number of enterprises reached during intervention	Project's M&E system	76 (a total of 1,800 workers)
Total average weekly income before intervention	1,000,000 local currency: baseline study	
Total fish production before intervention	6,000 tonnes: baseline study	
Number of enterprises which adopted the promoted methods	91%: tracer study	$76 * 91\% = 69$
Total average income after intervention	1,300,000 local currency: tracer study	$1,300,000 - 1,000,000 =$ 300,000 (30%) income increase since intervention started

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Promotion of production and innovation/Production increase/Increased income

ESTIMATE

Estimating improved income through non-representative sample

A water and wastewater management project with a focus on irrigated agriculture has established complaint management centers across its implementing region to provide

small scale farmers with the possibility to quickly report water supply issues. The results logic is that by improving access to services (complaint management centers), there can be

an increase in production as problems are reported and addressed promptly. This, then, leads to higher output and turnover, increasing income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	1,000
Numer of beneficiaries who called the complaint management center	98%: project's M&E system	$1,000 * 98\% = 980$
Number of beneficiaries who found the service effective	90%: project's M&E system	$980 * 92\% = 882$
Number of beneficiaries who said their income increased due to higher turnover	35%: focus group discussions	$882 * 35\% =$ 309 beneficiaries have potentially increased their income

STEP 3 Summary: your approach to evaluate employment effects

.5 Promotion of production and innovation/Production increase/Increased income

METHOD MAP 3.4 SUMMARY PAGE

Increased income

STEP 3 Next steps

.6 Promotion of production and innovation/Production increase/Increased income

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3.1 Define your results logic
 .1 Product diversification/Improvement of nutritional situation/New and additional employment

RESULTS LOGIC

DESCRIPTION

Improving the nutritional situation by diversifying a beneficiary's farm leads to better nutritional practices in households which improves health and, consequently, their employability, creating new or additional employment.

Furthermore, through product diversification, there is an increase in production that can result in higher labor demand, creating new or additional employment.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

STEP 3 Define the data you need

.2 Product diversification/Improvement of nutritional situation/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Product range before and after intervention

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Product diversification/Improvement of nutritional situation/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP

3 Define the data collection methods

3.3 Product diversification/Improvement of nutritional situation/New and additional employment

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Product diversification/Improvement of nutritional situation/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

4 Product diversification/Improvement of nutritional situation/New and additional employment

MEASURE

Example: Measuring new employment

A project with the objective of improving food security and nutrition provides trainings to its beneficiaries so that they can introduce nutritious foods in their

home garden. The results logic would be that through diversification of home gardens and increasing food quality, beneficiaries improve their nutrition practices and their health. This improves

their employability and can help them get new jobs or more working hours.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of households reached and average household size.	Project's M&E system	100 hh reached x 5 hh members each = 500 individuals reached
Number of people per household employed before intervention.	1 person in 38 households: baseline study	
No. of households with yield increase and at least 2 meals p.d. per household member as a result of the intervention.	87%: Annual household survey	$500 * 87\% = 435$
No. of household members with improved diet who report health improvements since intervention.	62%: Annual household survey	$435 * 62\% = 270$
Number of household members who reported that their health improvement allowed them to come into employment.	26%: Annual household survey	$270 * 26\% =$ 70 people came into new employment

STEP 3 Define the data analysis to evaluate effects

4 Product diversification/Improvement of nutritional situation/New and additional employment

ESTIMATE

Example: Estimating additional employment through reference values

A project with the objective of improving food security and nutrition has an activity in which it sets up home and kitchen gardens for women, with training

and distribution of seeds (vegetables) and tools. The results logic would be that through introducing new products in home and kitchen gardens, nutrition and health improve. Thus, leading to

better employability and new or additional employment.

No baseline data is available so the project will have to estimate its employment effects.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	1,100
Number of beneficiaries who increased yield of their home/ kitchen gardens	73%: project's M&E system	$1,100 * 73\% = 803$
Number of beneficiaries who have sold excess harvest	11%: follow-up survey with 20 women out of the 803 whose yield productivity increased	$803 * 11\% = 88$ 88 women potentially came into additional employment

STEP 3 Summary: your approach to evaluate employment effects

.5 Product diversification/Improvement of nutritional situation/New and additional employment

METHOD MAP 4.1 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

.6 Product diversification/Improvement of nutritional situation/New and additional employment

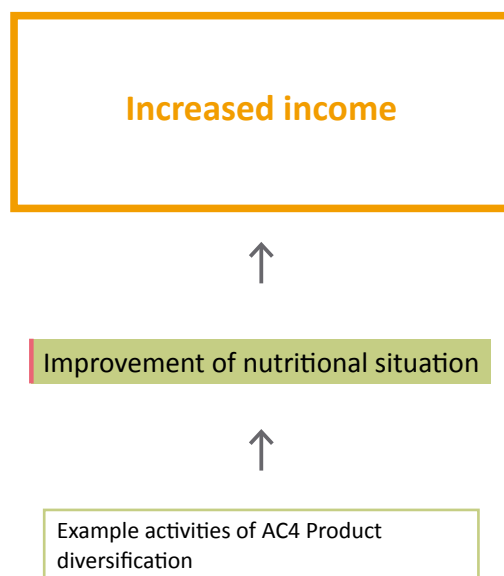

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Product diversification/Improvement of nutritional situation/Increased income

RESULTS LOGIC

DESCRIPTION

Through product diversification in beneficiaries' home garden or farm, a household's nutrition can be improved while also intensifying production. Overproduction can then be sold and improve income.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

.2 Product diversification/Improvement of nutritional situation/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Product range before and after intervention
- Yield that has been sold

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Product diversification/Improvement of nutritional situation/Increased income

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Product diversification/Improvement of nutritional situation/Increased income

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Product diversification/Improvement of nutritional situation/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

3.4 Product diversification/Improvement of nutritional situation/Increased income

MEASURE

Example: Measuring income increase

A project with the objective of improving food security and nutrition provides trainings to its beneficiaries so that they can introduce nutritious foods in their home garden. The results logic

would be that through introduction of an alternative product, beneficiaries improve their nutrition practices as well as production. Surplus production can be sold and generate additional cash income.

Derivation steps	Data source/Assumptions	Example calculation
Number of households reached and average household size	Project's M&E system	150 hh reached x 5 hh members each = 750 individuals reached
Average weekly income before intervention	100 local currency units: baseline study	
Number of households that said they have excess production of goat milk	43%: Annual household survey	750*43%= 322 households have improved their income

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

3.4 Product diversification/Improvement of nutritional situation/Increased income

ESTIMATE

Example: Estimating income increase

A project with the objective of improving food security and nutrition has an activity in which it sets up home and kitchen gardens for women, with training and distribution of seeds (vegetables) and tools.

The results logic would be that through product diversification in home and kitchen gardens nutrition is improved, as well as production. Surplus production can be sold and generate additional cash income. Additionally, at GIZ cash and

in-kind are considered as income increase; thus any additional production does not necessarily need to be sold.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	2,000
Number of households that reported to have improved their nutrition and yield productivity has increased	73%: project's M&E system	$2,000 * 73\% = 1,460$ 1,460 beneficiaries have potentially improved their income

STEP 3 Summary: your approach to evaluate employment effects

3.5 Product diversification/Improvement of nutritional situation/Increased income

METHOD MAP 4.2 SUMMARY PAGE

Increased income

STEP 3 Next steps

.6 Product diversification/Improvement of nutritional situation/Increased income

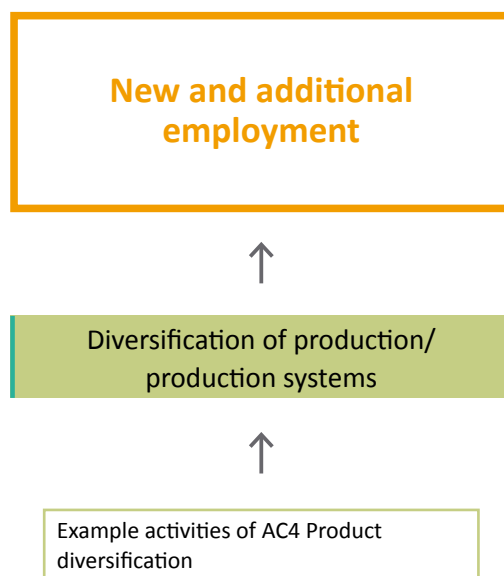

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Product diversification/Diversification/New and additional employment

RESULTS LOGIC

DESCRIPTION

Through the diversification of product range and addition of further products, there is an increase in production that can result in higher labor demand, creating new or additional employment.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

STEP 3 Define the data you need

.2 Product diversification/Diversification/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Product range before and after intervention

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Product diversification/Diversification/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Product diversification/Diversification/New and additional employment

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Product diversification/Diversification/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

4 Product diversification/Diversification/New and additional employment

MEASURE

Example: Measuring additional employment

A project focusing on the cocoa value chain aims to reduce the dependency of cocoa farmers on the volatile cocoa market by promoting innovations in the cultivation of complementary

food crops (plantain and cassava). The project targets 1,000 farmers.

The results logic would be that through diversification of the cocoa production system, beneficiaries increase their

production. This creates a higher labor input and, therefore can lead to an increase in new and additional employment.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of farmers reached	Project's M&E system	1,000
Total number of labor days per ha in cassava and plantain before intervention	0: baseline study	
Average farm size in ha	1: baseline study	
Number of farmers who have adopted the promoted innovation	73%: project's M&E system	$1,000 \times 73\% = 730$
Total number of labor days in cassava and plantain per ha after intervention	62 days, thereof 22 days reallocated from cocoa production = 40 labour days net additionally, taken from project's M&E system	$40 \times 1 \times 1,000 \times 73\% / 225 =$ 201 additional full-time equivalent (FTE)

Note: if the baseline figure was not 0, then you would need to calculate the additional labor days (current labor days - baseline labor days)

Read about [➔ Full-time equivalent \(FTE\)](#)

STEP 3 Define the data analysis to evaluate effects

4 Product diversification/Diversification/New and additional employment

ESTIMATE

Example: Estimating new employment using reference values

A project focuses on strengthening sustainable agriculture through agroecological farming practices such as intercropping and locally adapted seeds.

through diversification, beneficiaries can increase their production. This creates a higher labor input and, therefore can lead to an increase in new employment.

baseline. Therefore, it will have to estimate its intervention's potential employment effects.

The results logic would be that

The project has no baseline data and no resources to carry out a retrospective

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	27 enterprises
Number of enterprises that have adopted new practices	75%: project's M&E system	$27 * 75\% = 20$
Average number of newly hired people	4.5: reference value taken from another implementing country in which the project is in with similar characteristics	$20 * 4.5 =$ 90 people potentially came into employment

STEP 3 Summary: your approach to evaluate employment effects

.5 Product diversification/Diversification/New and additional employment

METHOD MAP 4.3 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

.6 Product diversification/Diversification/New and additional employment

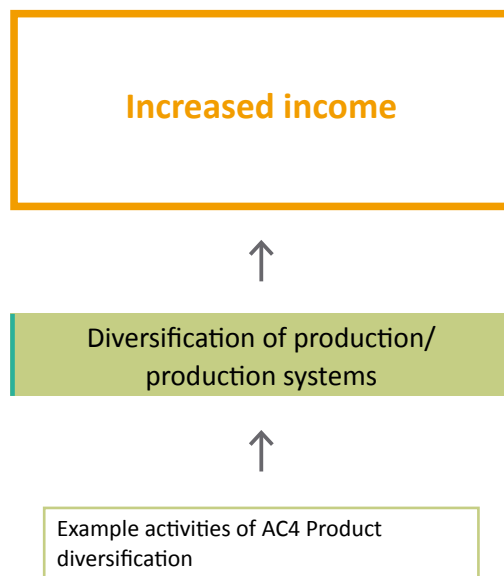

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Product diversification/Diversification/Increased income

RESULTS LOGIC

DESCRIPTION

Diversification of product range/production system leads to broader supply of products which can increase revenue, creating higher profits and increasing income, as well as reducing a beneficiarie's dependency on one product.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermerdiate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

.2 Product diversification/Diversification/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Product range before and after intervention

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Product diversification/Diversification/Increased income

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Product diversification/Diversification/Increased income

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Product diversification/Diversification/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

4 Product diversification/Diversification/Increased income

MEASURE

Example: Measuring income increase using before-after analysis

A project with focus on the cocoa value chain aims to reduce the dependency of cocoa farmers on the fluctuating market by promoting innovations in the cultivation of complementary foodstuffs (plantain and cassava).

The results logic would be that through diversification of the cocoa production system, beneficiaries increase their production. This creates a higher profits and improves their income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of farmers reached	Project's M&E system	1,000
Average weekly income in local currency units per farmer before intervention	100: baseline study	
Share of farmers who have adopted the innovation and realized an income increase	68%: annual household survey	1,000*68%= 680 farmers increased their income
Seasonal income per farmer in local currency unit after intervention	142: tracer study with 150 farmers out of the 680 who adopted innovations	142-100= Income has improved by 42 local currency units

STEP 3 Define the data analysis to evaluate effects

4 Product diversification/Diversification/Increased income

ESTIMATE

Example: Estimating improved income using a reference value

A project focuses on strengthening sustainable agriculture through agroecological farming practices such as intercropping and locally adapted seeds.

The results logic would be that through diversification, beneficiaries can increase their production and, therefore, improve their profits and income.

The project has no baseline data. Therefore, it will have to estimate its intervention's potential employment effects.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of farmers reached	Project's M&E system	1,000
Number of farmers who have adopted agroecological farming practices	77%: annual survey conducted with a representative sample of 278	$1,000 * 77\% = 770$
Latest average weekly income per farmer in local currency	1,050: survey conducted with 200 farmers	
Number of farmers who said their income has increased since intervention	80%: survey conducted with 200 farmers	$770 * 80\% =$ 616 farmers reported an increase in income
Average income per season in local currency the year before intervention started	950: reference value taken from World Bank's Living Standards Measurement Study - Integrated Surveys on Agriculture (LSMS-ISA) dataset on household surveys	$1,050 - 950 =$ 100 local currency units increase in farmer's income

STEP 3 Summary: your approach to evaluate employment effects

.5 Product diversification/Diversification/Increased income

METHOD MAP 4.4 SUMMARY PAGE

Increased income

STEP 3 Next steps

.6 Product diversification/Diversification/Increased income

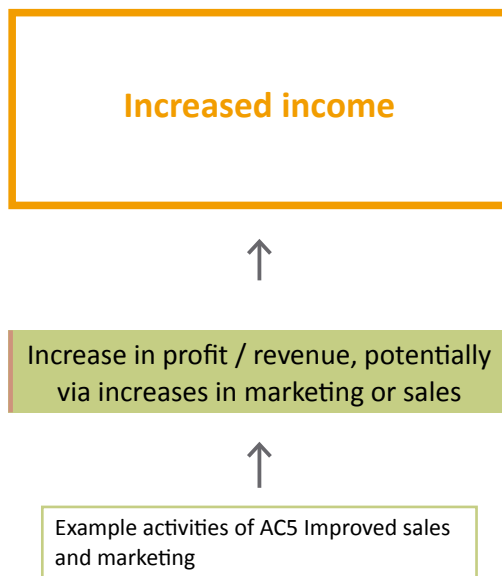

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

3.1 Improved sales and marketing/Profit and revenue increase/Increased income

RESULTS LOGIC

DESCRIPTION

Improved marketing efforts lead to increase in sales, which results in higher profit/turnover and, therefore, more income.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

.2 Improved sales and marketing/Profit and revenue increase/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Baseline and follow-up data on **marketing behavior** (i.e. through a survey)

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Improved sales and marketing/Profit and revenue increase/Increased income

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Improved sales and marketing/Profit and revenue increase/Increased income

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Improved sales and marketing/Profit and revenue increase/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Improved sales and marketing/Profit and revenue increase/Increased income

MEASURE

Example: Measuring income increase through before and after comparison

A project supports 7,000 smallholder farmers in three selected regions to formalize their sales and marketing channels for livestock and small animal husbandry through advisory services. The results logic is that through the introduction of formalized marketing channels there is an increase in sales and revenue. This leads to improved income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of farmers reached	Project's M&E system	7,000
Number of farmers who regularly used leaflets and social media before the intervention	10%: survey conducted after project support (retrospective baseline)	60-10= 50% in improvement implementation quota. Meaning that 3,500 beneficiaries use new marketing channels.
Number of farmers who regularly used leaflets and social media after the intervention	60%: survey conducted after project support	
Number of farmers who also reported increase in revenue after the intervention	95%: survey conducted after project support	3,500*95%= 3,325 beneficiaries improved their revenue
Av. income per week on local currency before and after the intervention	500: survey conducted after project support (retrospective baseline) 650: same survey	650-500= 150 currency units (30%) per week increase in income

STEP 3 Define the data analysis to evaluate effects

.4 Improved sales and marketing/Profit and revenue increase/Increased income

ESTIMATE

Example: Estimating income increase

A project aiming to improve food security through small scale irrigation provides advisory services on marketing agricultural products to 4,000 producers.

The results logic is that improving marketing strategies through

advisory services lead to an increase in sales and profit, improving beneficiaries' income.

The project has no baseline data to measure effects so it will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of producers reached	Project's M&E system	4,000
Number of beneficiaries who implemented the promoted marketing strategies	60%: project's M&E system	$4,000 * 60\% = 2,400$
Number of beneficiaries who said their revenue has increased since intervention	87%: survey with a non-representative sample of 150	$2,400 * 87\% = 2,088$
Number of beneficiaries with revenue increase who also reported an increase in income since intervention	65%: survey with a non-representative sample of 150.	$2,088 * 65\% =$ 1,375 beneficiaries have potentially improved their income

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

3.5 Improved sales and marketing/Profit and revenue increase/Increased income

METHOD MAP 5.1 SUMMARY PAGE

Increased income

STEP 3 Next steps

3.6 Improved sales and marketing/Profit and revenue increase/Increased income

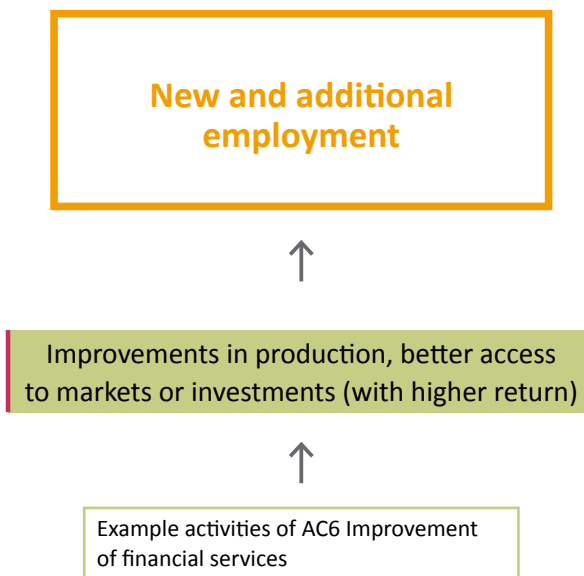

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Financial services/Improvements/New and additional employment

RESULTS LOGIC

DESCRIPTION

(Improved access to financial services leads to) Utilization of financial services can have an impact on different levels (production, access to market, investment, etc.) which increase production, creating more labor demand and potentially new or additional employment.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

STEP 3 Define the data you need

.2 Financial services/Improvements/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Revenue and sales
- Available offers and bank supply
- Loans and transactions, as well as number of business partners
- Market outreach

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

➔ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Financial services/Improvements/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Financial services/Improvements/New and additional employment

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Financial services/Improvements/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Financial services/Improvements/New and additional employment

MEASURE

Example: Measuring additional employment through before and after comparison

A project aims to strengthen the actors along the coffee value chain. One of its activity packages is to support Micro, Small & Medium Enterprises (MSME) in the value chain to gain access to start-up capital. In doing so, the project provides these MSME with enterprise development

and financial training (e.g. on business plan development or on how to write a credit application). On the other hand, the project works with banks and micro finance institutions on the development of suitable financial products. Furthermore the project has developed an app for the matchmaking of financial products and SME in search for credit.

The results chain is that MSME access the developed financial products via the developed app and invest credits in their businesses leading to business growth, resulting in employment creation and income increases.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
MSMEs trained	Project's M&E system	200
MSMEs accessing credit	Project's M&E system	$200 \times 80\% = 160$
MSMEs realizing business growth	Survey by the project	$160 \times 85\% = 136$
Number of persons in MSMEs realizing business growth with improved income & more working hours	Average of 1.5 persons with income increase & more working hours per MSMEs realizing business growth; project follow-up study with MSMEs	$136 \times 1.5 =$ 204 persons with additional employment
Number of persons newly hired in MSMEs since realization of business growth	Average of 0.5 persons newly hired in MSMEs since realization of business growth; project follow-up study with MSMEs	$136 \times 0.5 =$ 68 persons with new employment

STEP 3 Define the data analysis to evaluate effects

.4 Financial services/Improvements/New and additional employment

ESTIMATE

Example: Estimating new employment using national statistics

A project focuses on strengthening financial services and promoting finance options for start-ups and young entrepreneurs. One of their activities is to support the development of a micro-finance

product.
The results logic is that by improving access to financial services, beneficiaries will use these services in order to finance different business aspects (production, access to markets, etc.).

This will lead to increase in labor demands, creating new jobs.
The project has no baseline data and will therefore need to estimate.

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	15,000
Number of beneficiaries who use the new product	20%: implementing partner's monitoring system	$15,000 * 20\% = 3,000$
Number of beneficiaries who used the financing to start a business	25% : follow up survey	$3,000 * 25\% = 750$
Av. number of paid employees per micro-enterprise	1: national statistics	$750 * 1 =$ 750 new employees
Number of beneficiaries who used the financing to expand their existing business	40%: follow up survey	$3,000 * 40\% = 1,200$
Av. number of new employees through expansion	1.5: national statistics	$1,200 * 1.5 =$ 1,800 new employees
Total number of beneficiaries that came into employment		$1,800 + 750 =$ 2,550 potentially came into employment

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Financial services/Improvements/New and additional employment

METHOD MAP 6.1 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

6.6 Financial services/Improvements/New and additional employment

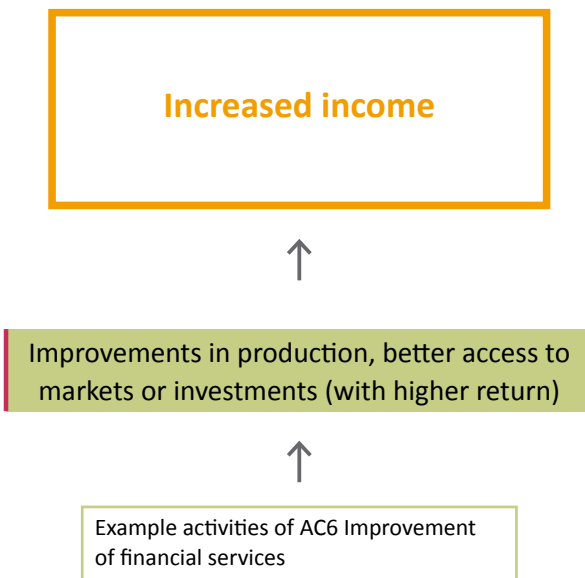

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

3.1 Financial services/Improvements/Increased income

RESULTS LOGIC

DESCRIPTION

(Improved access to financial services leads to) Utilization of financial services can impact different aspects (such as production, better access to market, investment, etc.) which leads to an increase in revenue and, consequently, an increase in income

Improved market access leads to increased output / sales leading to increased revenue and income.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

3.2 Financial services/Improvements/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Revenue and sales
- Available offers and bank supply
- Financial services: available offers and bank supply
- Access to markers: outreach and no. business partners
- Use or services: data on loans and transactions

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

➔ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Financial services/Improvements/Increased income

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Financial services/Improvements/Increased income

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Financial services/Improvements/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Financial services/Improvements/Increased income

MEASURE

Example: Measuring increased income through before and after comparison

A project aims to strengthen the actors along the coffee value chain. One of its activity packages is to support Micro, Small & Medium Enterprises (MSME) in the value chain to gain access to start-up capital. In doing so, the project provides these MSME with enterprise development

and financial training (e.g. on business plan development or on how to write a credit application). On the other hand, the project works with banks and micro finance institutions on the development of suitable financial products. Furthermore the project has developed an app for the matchmaking of financial products and SME in search for credit.

The results chain is that MSME access the developed financial products via the developed app and invest credits in their businesses leading to business growth, resulting in employment creation and income increases.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
MSMEs trained	Project's M&E system	200
MSMEs accessing credit	Project's M&E system	$200 \times 80\% = 160$
MSMEs realizing business growth	Survey by the project	$160 \times 85\% = 136$
Number of persons in MSMEs realizing business growth with improved income	Average of 2.5 persons with income increase per MSMEs realizing business growth; project follow-up study with MSMEs	$136 \times 2.5 =$ 340 persons with increase income

STEP 3 Define the data analysis to evaluate effects

.4 Financial services/Improvements/Increased income

ESTIMATE

Example: Estimating increased income using secondary data and a non-representative sample

An agricultural financing and rural development program aims to improve agricultural-based development in selected districts of a country. One area of the technical cooperation activities focuses on the establishment of enterprises and MSMEs upstream

and downstream in selected agricultural value chains. Part of that effort is to improve access to financial services for the newly-established enterprises or MSMEs.

The results logic is that through the use of financial services (i.e. taking out

a loan for production) there is potential to improve production, better access to markets or investments (with higher return), which all lead to higher revenue and, thus, potentially increase income.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of enterprises reached	Project's M&E system	3,000
Number of enterprises that used the provided financial services	40%: project's M&E system	$3,000 * 40\% = 1,200$
Number of enterprises who used the services and increased their production	30%: project;s M&E system	$1,200 * 30\% = 360$
Number of enterprises that said their employees' salary has increased	32%: non-representative enterprise survey	$360 * 32\% = 115$
Av. enterprise size	4: national statistics	$115 * 4 =$

460 people have potentially improved their income

STEP 3 Summary: your approach to evaluate employment effects

3.5 Financial services/Improvements/Increased income

METHOD MAP 6.2 SUMMARY PAGE

Increased income

STEP 3 Next steps

6 Financial services/Improvements/Increased income

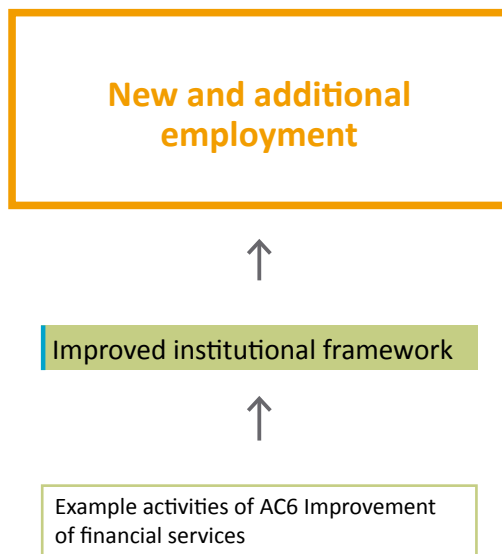

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3.1 Define your results logic

Financial services/Improved Institutional Framework/New and additional employment

RESULTS LOGIC

DESCRIPTION

Changes in the regulatory framework facilitate job creation or job finding (e.g. through de-regulation or improved job matching) and job characteristics. This mechanism concerns global framework changes (i.e. typically at the national / government or other superordinate level).

BEAR IN MIND...

Overarching advisory activities and global (i.e. national level) institutional changes are difficult to assess through measurement, therefore the **most suitable approach is to estimate** using a descriptive analytical method, which makes plausible each step/assumption in the results logic using primary and secondary data.

Therefore Method Map 6.3 focuses on providing a comprehensive range of data collection methods in order to help you conduct a descriptive analysis. Only estimation approaches will be shown.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

STEP 3 Define the data you need

.2 Financial services/Improved Institutional Framework/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Monitoring requirements

- Number of trained ministry officials
- Number of implemented regulations/reforms
- Monitor changes in regulations
- etc.

Bear in mind...

As previously said, the **most suitable approach is to estimate** the potential employment effects using a descriptive analytical method. This means you need to justify each step in the results logic.

For instance, monitoring would need to collect data of the step-by-step approach in the results logic: (i) prove that output was attained (number of ministry officials trained), (ii) prove that outcomes were affected (number of regulations implemented), (iii) combine with labor market data on connectable indicators: job growth in the economy, or number of new businesses registered, etc.

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

DEFINE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Financial services/Improved Institutional Framework/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Financial services/Improved Institutional Framework/New and additional employment

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Financial services/Improved Institutional Framework/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

GO TO THE NEXT PAGE TO DEFINE YOUR APPROACH

STEP 3 Define the data analysis to evaluate effects

.4 Financial services/Improved Institutional Framework/New and additional employment

ESTIMATE

Example: Estimating new employment

A rural and agricultural finance project, in cooperation with the KfW, works on improving agricultural financing opportunities for the actors along agricultural value chains in the country. The project mainly targets an improvement through a change in regulatory framework conditions for financial services by advising on four new agricultural credit products, which will be introduced in national banks.

The results logic is that improvement of the regulatory framework conditions of financial services facilitates the investment climate and business creations, which potentially leads to employment effects such as improved incomes or new employment opportunities.

Overarching advisory activities and global (i.e. national-level)

institutional changes are difficult to be assessed through measurement and, therefore, estimation is the most suitable approach.

An estimation approach typically follows the logic of linking the activity with an employment outcome, justifying each step with collected data (qualitative, quantitative, primary and secondary). In this theoretical example, for instance, you could:

- Monitor and document that the overarching regulatory frameworks were actually devised, i.e. check official communications, updated from NGOs or civil societies, etc.
- Document that financial institutions have introduced the four new agricultural credit products. In addition, document that these new products are actually used by clients of the banks. Monitor the number of clients of the bank using the products (Bank-based data collection).
- Conduct a survey (representative sample if possible) on the clients of the bank to confirm they actually use the products. Potentially ask them to confirm their usefulness.

Then an estimation could be as followed:

Given that there is monitoring evidence that (i) regulatory framework was reformed, that (ii) banks have introduced new agricultural credit products that are (iii) actually used by clients: suppose 2,000 target agricultural enterprises (according to bank data) use the products, and that these enterprise have employed a total of 5,000 individuals. A survey of these enterprises shows that for 10% their business has improved (revenue, sales and/or profit). Then the project can estimate that (5,000 x 10%) **500 people came into new employment/reduced their underemployment.**

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Financial services/Improved Institutional Framework/New and additional employment

METHOD MAP 6.3 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

6 Financial services/Improved Institutional Framework/New and additional employment

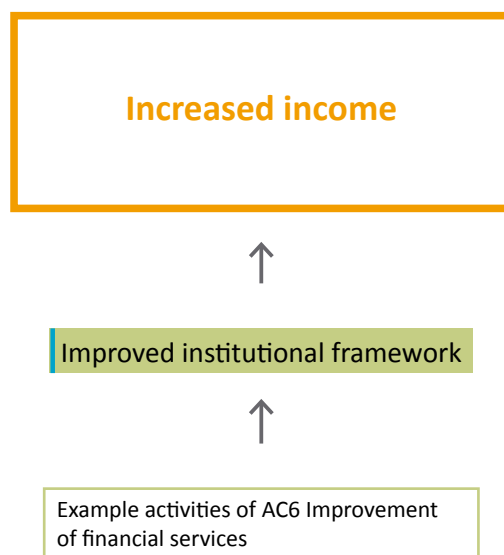

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Financial services/Improved Institutional Framework/Increased income

RESULTS LOGIC

DESCRIPTION

Changes in the regulatory framework facilitate job creation or job finding (e.g. through de-regulation or improved job matching) and job characteristics, improving also income. This mechanism concerns global framework changes (i.e. typically at the national / government or other superordinate level).

BEAR IN MIND...

Overarching advisory activities and global (i.e. national level) institutional changes are difficult to assess through measurement, therefore the **most suitable approach is to estimate** using a descriptive analytical method, which makes plausible each step/assumption in the results logic using primary and secondary data.

Therefore Method Map 6.4 focuses on providing a comprehensive range of data collection methods in order to help you conduct a descriptive analysis. Only estimation approaches will be shown.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

.2 Financial services/Improved Institutional Framework/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Monitoring requirements

- Number of trained ministry officials
- Number of implemented regulations/reforms
- Monitor changes in regulations
- etc.

Bear in mind...

As previously said, the **most suitable approach is to estimate** the potential employment effects using a descriptive analytical method. This means you need to justify each step in the results logic.

For instance, monitoring would need to collect data of the step-by-step approach in the results logic: (i) prove that output was attained (number of ministry officials trained), (ii) prove that outcomes were affected (number of regulations implemented), (iii) combine with labor market data on connectable indicators: job growth in the economy, or number of new businesses registered, etc.

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

DEFINE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Financial services/Improved Institutional Framework/Increased income

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Financial services/Improved Institutional Framework/Increased income

 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3.1 Define your results logic

Cash-for-work measures/New and additional employment

RESULTS LOGIC

DESCRIPTION

Cash-for-work measures immediately affect new/additional employment, as well as income increase, due to their short-term duration. Therefore, there are no intermediate outcomes.

Note: you will need to monitor actual implementation of the activity.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

STEP 3 Define the data you need

.2 Cash-for-work measures/New and additional employment

THESE DATA ARE NEEDED TO REPORT ON **NEW EMPLOYMENT** AND/OR **ADDITIONAL EMPLOYMENT**

Data needed based on the specific intermediate (employment) result

- Monitor actual implementation of the activity

Data needed to calculate employment effects (see [here](#) for more details)

- Share of employed people before and after; number of employees before and after for New Employment
- Measure of working hours/days (employment periods) before and after for Additional Employment
- Number of beneficiaries in number of persons and FTE, if possible

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#), [Full-time equivalent \(FTE\)](#)

DEFINE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data collection methods

.3 Cash-for-work measures/New and additional employment

SELECT TO READ ABOUT

REFLECT ABOUT SUITABLE DATA COLLECTION METHOD(S) FOR YOUR PROJECT

Remember you can use more than one method for your data if necessary or even consider looking into some that are not mentioned in the list

Guiding questions:

- What existing data collection tools of my M&E-system can be used and adopted?
- Who can my project collect primary data from? Which data can be covered?
- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Cash-for-work measures/New and additional employment

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Cash-for-work measures/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Cash-for-work measures/New and additional employment

MEASURE

Example: Measuring new employment through before and after comparison

A project focusing on the protection of waterdams uses 30 Cash-for-work (C4W) measures to secure water supply by employing forcibly displaced people and needy people from host communities.

The results logic is that C4W measures have an immediate and direct effect in creating new and additional jobs.

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	1,500
Number of beneficiaries who said they were not employed before the intervention	40%: baseline survey	1500*40= 600 beneficiaries came into temporary employment
Average number of man days per beneficiary	30: exit survey	600*30= 18,000 man days were worked by beneficiaries who came into new employment

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Cash-for-work measures/New and additional employment

ESTIMATE

Example: Estimating additional employment through spot checks

A project focusing on the protection of waterdams uses 30 Cash-for-work (C4W) measures to secure water supply by employing forcibly displaced people and needy people from host communities.

The results logic is that C4W measures have an immediate and direct effect in creating other (new and additional) jobs. There is no baseline data so effects will have to be estimated:

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	1,500
Of which are displaced people	Project's M&E system	1,000
Of which are from the host community	Project's M&E system	500
Number of beneficiaries who reported to have other employment opportunities	25%: non-representative survey with a sample size of 50. The project decides to use this as a reference value	$1,500 * 25\% =$ 375 people potentially obtained other (new and additional) employment opportunities

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Cash-for-work measures/New and additional employment

METHOD MAP 7.1 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

.6 Cash-for-work measures/New and additional employment

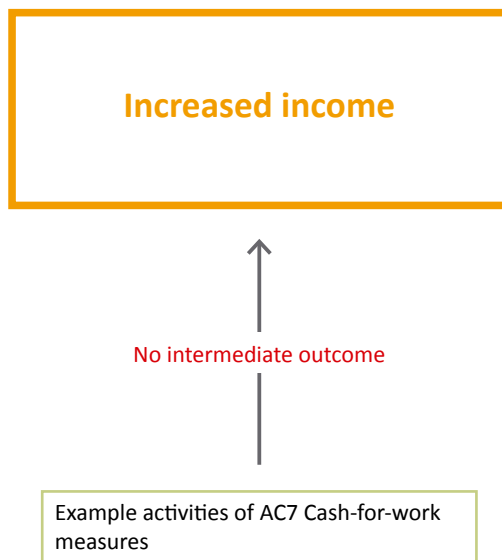

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects. Please note that Cash-for-work measures are not covered by indicator KT3.4 of the BMZ 2030 Standard Indicators but can be measured under indicator KT1.5 instead (number of people who have received social protection or whose social protection has been improved). (see Ind. Def. Sheet 3.4)

STEP 3 Define your results logic

.1 Cash-for-work measures/Increased income

RESULTS LOGIC

DESCRIPTION

Cash-for-work measures immediately affect new/additional employment, as well as income increase, due to their short-term duration. Therefore, there are no intermediate outcomes.

Note: you will need to monitor actual implementation of the activity.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

STEP 3 Define the data you need

.2 Cash-for-work measures/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

- Monitor actual implementation of the activity

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

DEFINE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

→ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

- What is the best method for my beneficiary group?
- How can the data be captured throughout the implementation of activities (e.g. participants lists, workshop documentation, etc).
- Which secondary sources cover the data needs?
- What are the (human, financial and technical) resources and time my project have to conduct data collection?

STEP 3 Define the data collection methods

.3 Cash-for-work measures/Increased income

WHICH METHODS CAN MY PROJECT USE TO EVALUATE THE NECESSARY DATA?

These are the data you chose to evaluate in part 3.2:

Remember, you read about these types of data collection methods and data source:

[Click to return to data collection methods](#)

INSERT THE DATA COLLECTION METHOD(S) YOU ARE GOING TO USE FOR EACH DATA:

ARE MY DATA COLLECTION METHODS SUITABLE TO MEASURE OR ESTIMATE EMPLOYMENT EFFECTS?

STEP 3 Define suitability of data to measure or estimate

.4 Cash-for-work measures/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Cash-for-work measures/Increased income

MEASURE

Example: Measuring increased income

A project has implemented 20 Cash-for-works (C4W) measures which aim to provide income generating opportunities through reconstruction of vital community infrastructure and livelihoods to a region impacted by a natural disaster

The results logic is that C4W measures have an immediate and direct effect on beneficiaries' employment, leading to income increase.

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	500
Number of beneficiaries who reported that the C4W measures was their only source of income	97%: Project's M&E system	500*97%= 485 beneficiaries have increased their income
Average number of total man days worked per beneficiary	22: Project's M&E system, data collected from timesheets	485*22*3 = 32,010 EUR of total income increase
Daily wage per beneficiary	3 EUR: Project's M&E system	

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Define the data analysis to evaluate effects

.4 Cash-for-work measures/Increased income

ESTIMATE

Example: Estimating increased income

A project has implemented 20 Cash-for-works (C4W) measures which aim to provide income generating opportunities through reconstruction of vital community infrastructure and livelihoods to a region impacted by a natural disaster

The results logic is that C4W measures have an immediate and direct effect on beneficiaries' employment, leading to income increase.

As a monitoring measure timesheets were given to beneficiaries, however many of these either got lost or were

never retrieved, impacting the data quality as well as daily wage information. Therefore the project will have to estimate:

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	500
Number of timesheets collected	100: Project's M&E system	
Average man days worked per beneficiary from the collected timesheets	15: Collected timesheets. Project decides to use this as a reference value	500*15*3= 22,500 EUR of total estimated income increase
Daily wage per beneficiary	3 EUR: Project's M&E system	

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

STEP 3 Summary: your approach to evaluate employment effects

.5 Cash-for-work measures/Increased income

METHOD MAP 7.2 SUMMARY PAGE

Increased income

STEP 3 Next steps

.6 Cash-for-work measures/Increased income

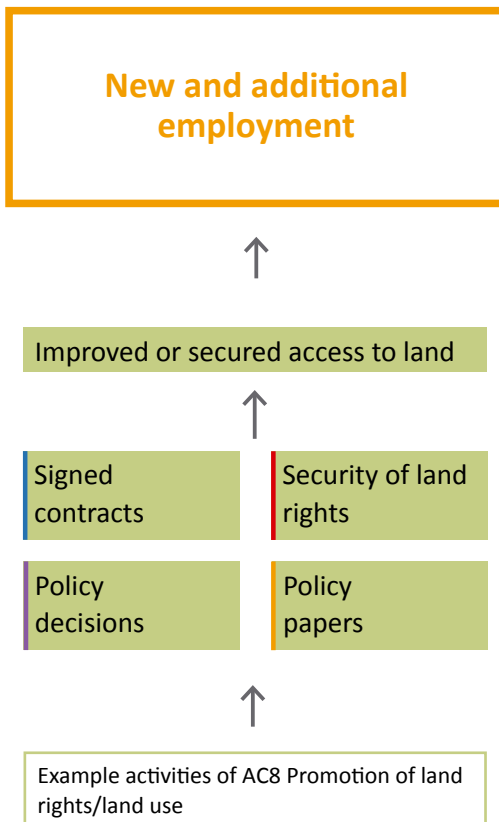

You have completed all the steps in this method map. Choose what you want to do next:

- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3.1 Define your results logic

.1 Improve land rights and land use/Improved or secured access to land/New and additional employment

RESULTS LOGIC

DESCRIPTION

Any of the four intermediate outcomes can be plausibly linked provide improved or secured access to land to beneficiaries. This can create higher labor demands and increase new and additional employment.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

New and additional employment

STEP 3 Define suitability of data to measure or estimate

.4 Improve land rights and land use/Signed contracts/Improved or secured access to land/New and additional employment

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define suitability of data to measure or estimate

.4 Improve land rights and land use/Security of land rights/Improved or secured access to land/New and additional employment

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

3.4 Improve land rights and land use/Signed contracts/Improved or secured access to land/New and additional employment

MEASURE

Example: Measuring new employment through before and after comparison

A project focuses on improving framework conditions for good land governance by introducing transparent procedures and methods in land administration.

The project's target group is 10,000 people in a specific district in country "A". One of

their activities is to build capacities to develop an official rural land registry where village residents' land rights are recorded and plots registered. Through the project's assistance and capacity building, 5,000 plots were registered and 3,200 land titles issued.

The results logic is that by providing

beneficiaries with the security of land rights they improve their access to land. This can potentially increase production/ access to financial services/ access to markets (etc.) which can lead to higher labor demand and create new or additional employment.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	10,000
Number of beneficiaries who had their plots registered or land titles issued	63%: Project's M&E system	$10,000 * 63\% = 6,300$
Number of beneficiaries who used the plot to grow crops and have sold excess production	32%: Follow up survey	$6,300 * 32\% = 2,016$
Number of beneficiaries who reported they were without employment before the intervention	22%: Follow up survey	$2,016 * 22\% =$ 443 people came into employment through the intervention

STEP 3 Define the data analysis to evaluate effects

3.4 Improve land rights and land use/Security of land rights/Improved or secured access to land/New and additional employment

MEASURE

STEP 3 Define the data analysis to evaluate effects

3.4 Improve land rights and land use/Signed contracts/Improved or secured access to land/New and additional employment

ESTIMATE

Example: Estimating additional employment through external sources

A project focuses on promoting sustainable land use to increase agricultural production and to improve market access to small-holder farmers. It provides advisory services to the government by jointly developing strategic documents.

The results logic is that through the development of strategic papers, framework conditions are improved and lead to implementation of reforms or development of policy papers. This will improve farmers' access to land and potentially increase production and output, which would require more labor demand and

create new/additional jobs. Through the project's contribution, 21 land use plans were developed, the Ministry of Agriculture's (partner) capacities to manage and contribute to land conservation have improved.

Derivation steps	Data source/Assumptions	Example calculation
Number of beneficiaries reached	Project's M&E system	50,000
Proportion of farmers most likely to be affected by new framework	75%: Policy impact assessments and MoA statistics. Used as a reference value	$50,000 * 75\% = 37,500$
Number of beneficiaries who have come into contact with new framework conditions	41%: Survey conducted with beneficiaries	$37,500 * 41\% = 15,357$
Number of beneficiaries who said their working time has increased	36%: follow up survey	$15,375 * 36\% =$ 5,535 have potentially reduced their level of underemployment
Additional labor days needed for farming activities	20: reference value from other GIZ interventions in the same region	$5,535 * 20 / 225 =$ 492 FTEs were created

.5 Improve land rights and land use/Policy papers/Improved or secured access to land/New and additional employment

METHOD MAP 8.1 SUMMARY PAGE

New and additional employment

STEP 3 Next steps

.6 Improve land rights and land use/Improved or secured access to land/New and additional employment

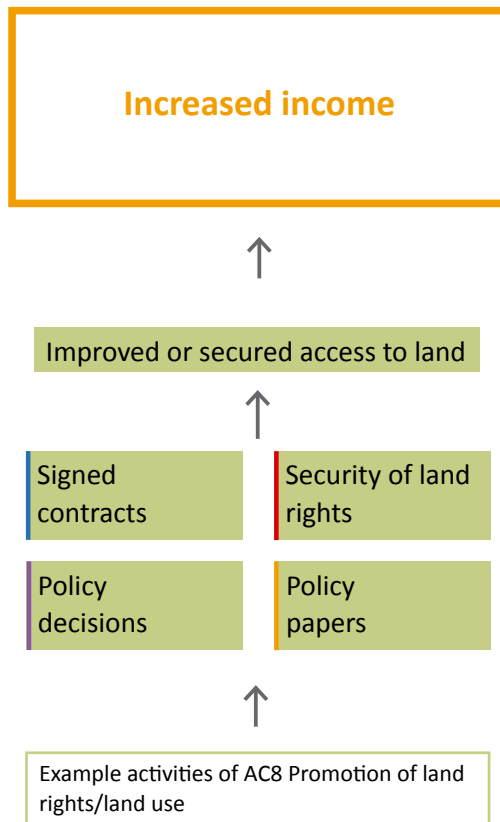

You have completed all the steps in this method map. Choose what you want to do next:

- Return to the first page of the method map to evaluate other intermediate (employment) results.
- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

STEP 3 Define your results logic

.1 Improve land rights and land use/Improved or secured access to land/Increased income

RESULTS LOGIC

DESCRIPTION

Any of the four intermediate outcomes can be plausibly linked to “improved access to land” which in turn leads to production expansion and/or crop expansion. This increases output, leading to higher revenue and income.

WHAT IS THE RESULTS LOGIC OF MY PROJECT?

Think about the linkage your project activity has to one of these intermediate results. Try to be as specific as possible and define the skills, competencies, abilities and employability improved by your project activity. Illustrate your results logic below. Be aware that this is a model, choose the intermediate result that seems most relevant to your context.

Increased income

➔ SELECT YOUR CHOSEN PRELIMINARY INTERMEDIATE RESULT

STEP 3 Define the data you need

.2 Improve land rights and land use/Signed contracts/Improved or secured access to land/Increased income

THESE DATA ARE NEEDED TO REPORT ON **INCREASED INCOME**

Data needed based on the specific intermediate (employment) result

Data needed to calculate employment effects (see [here](#) for more details)

- Income before and after intervention
- Number of beneficiaries

Additional variables to consider

Remember, your project can also collect these variables for its control groups (if any)

Read about [→ Control groups](#)

COPY AND PASTE AND CONTEXTUALISE ALL DATA YOU WILL NEED TO EVALUATE THE EMPLOYMENT EFFECT OF YOUR PROJECT.

➔ DOES YOUR M&E SYSTEM ALREADY COVER ALL DATA NEEDED?

and skip Data collection

STEP 3 Define the data you need

.4 Improve land rights and land use/Policy papers/Improved or secured access to land/Increased income

SELECT TO READ ABOUT

CHOOSE A SUITABLE APPROACH FOR YOUR PROJECT

You need to take into account the data collection methods you chose as they determine the approach.

Some guiding questions. Note: the more you answer "yes", the more suitable it would be to measure:

- Does my project have all data collected directly from beneficiaries or out of the activities?
- Are there comparison/reference values (e.g. baseline or control group) available for my project to use?
- Is my project's sample representative?
- My project does not have a fully representative sample but the quality of the data collection arrangements (survey design, training of enumerators, etc.) is very high.

 **ARE YOU GOING TO MEASURE OR ESTIMATE?**

STEP 3 Define the data analysis to evaluate effects

.4 Improve land rights and land use/Signed contracts/Improved or secured access to land/Increased income

MEASURE

Example: Measuring income increase through before and after comparison

A project, under the program wing of sustainable land management, focuses on the promotion of participatory forest management. One activity area of the project promotes the establishment of land utilization agreements between the rural community and forest owners.

The results logic is that the promotion of land utilization agreements leads to these being signed (which also secure land rights for beneficiaries) improving access to land. This then causes production expansion (and/or higher investments/intensification, additional labor on the plots) and higher output, increasing revenue and income.

Through the project's intervention, 2 land use agreements between a village community of 5,000 inhabitants and forest owners was signed. From 5,000, 30% work as smallholder farmers. A follow-up survey finds that agricultural usability increased 10%.

INSERT YOUR PROJECT SPECIFIC DATA ANALYSIS (FROM DATA TO DERIVATION OF EMPLOYMENT EFFECT)

You can use the example to help you derive your project's employment effects from your data

Derivation steps	Data source/Assumptions	Example calculation
Number of farmers reached	Project's M&E system	1,500
Number of beneficiaries who reported their revenue has increased	20%: Follow up survey with a sample of 341	1,500*20%= 300 farmers have increased their revenue and income
Av. weekly income in local currency before intervention	700: baseline study	820-700= 112 in local currency units weekly income increase
Av. weekly income after intervention	820: follow up survey	

STEP 3 Define the data analysis to evaluate effects

.4 Improve land rights and land use/Security of land rights/Improved or secured access to land/Increased income

MEASURE

STEP 3 Next steps

.6 Improve land rights and land use/Improved or secured access to land/Increased income

You have completed all the steps in this method map. Choose what you want to do next:

- Return to the first page of the method map to evaluate other intermediate (employment) results.
- Return to Step 2 to work on another method map in the activity cluster.
- Return to Step 1 to evaluate another activity cluster
- Go to resources to read more about the different topics covered, such as sampling or control groups.
- Save the document and bring your summary page to life:
 - Start the data collection;
 - Estimate or measure the employment effects of your project;
 - Report the effects to the BMZ 2030 Standard Indicators or SEWOH aggregated indicators.

Sampling

When is a sample representative?

A sample of beneficiaries is representative when the characteristics of the individuals or firms surveyed are very similar to the total of all beneficiaries.

How to ensure an accurate and precise sample?

- Clarify your sampling frame: identify your specific unit you wish to study from your population, i.e. all farmers who harvest two or more value chains.
- Decide on an appropriate sample size: do not be fooled, your sample size has little to do with the size of your entire population. It should be based on your budget/resources/time availability, number of subgroups to be analysed, desired confidence level (usually 95%) and margin of error (usually 5%). Use sample size calculators to help you. On the right side, you can find them. For more

information on the importance of confidence level and margin of error in a sample, see list on the right.

- Select your sampling method: probability sampling or non-probability sampling. In probability sampling, each person or object has an equal chance of being selected. Non-probability sampling is based on a researcher's choice. For some sampling methods, it is a requirement to have a sampling frame which is a list with all the elements of the population. In GIZ's Monitoring of Employment Effects Workbook pages 60-66 you can find the different methods and how to pick one. Another internal source is GIZ's Sampling Strategies.

How to choose the best sampling method?

At GIZ the following methods are recommended, however you may

consider others if needed:

- Simple random sampling is recommended as the standard method for GIZ employment programmes since a random sample is generally representative of the underlying population.
- Stratified sampling is often the preferred option when a project needs to report disaggregated data for different subgroups of a population. Stratification is also a practical solution when data from different training cohorts needs to be collected at different times.
- However, non-probability sampling is usually not representative and not recommendable for results-based monitoring. Non-probability sampling methods are helpful for qualitative evaluations and may serve as a second-best-option if probability sampling is not feasible.

Secondary data collection

Primary data is methodologically the most accurate way to measure employment effects but often, due to lack of resources, we have to use data from other sources. This is known as secondary data.

When to use secondary data?

Criteria to consider using secondary data:

- **Availability:** does this data exist and can you access it?
- **Relevance:** is this data relevant to what you want to do?
- **Time/effort:** do you have time/resources to collect primary data? If not, then secondary data can be helpful.
- **Contribution:** is this data going to contribute to the different

elements needed for your evaluation? Make sure it gives you a realistic picture of your project.

Where to find reliable sources for secondary data collection?

Below a list of potential sources to collect secondary data:

- governments often collect statistics, such as electoral data, minimum wage or housing information;
- international or multinational agencies such as the UN or FAO generate large amounts of statistics within and across different countries, as well as databases;
- newspaper articles or other forms of media report may contain useful information;
- many public service agencies, such as schools, hospitals and agricultural institutions, generate data that can be used for M&E;

- research studies and other forms of academic literature may contain useful information and have usually gone through a degree of quality control;
- many development agencies, including CSOs, produce reviews, evaluations and impact assessments that can be valuable secondary data sources for others.

Control groups

What is a control group? Why is it important?

One of the main objectives in M&E is to assess the changes an intervention has brought upon a target group. A standard approach is to compare the data before and after (**gross effects**). However, how do we know that these changes were caused by our intervention and not **external factors**? For this the most common approach is to assess which changes can be attributed to the intervention by comparing with our beneficiaries with a group who was not exposed to our intervention (**net effects**).

When to select a control group?

The need to use a control group depends on the type of intervention. For some, it may be possible to have a control group while for others, it is not. For instance, community targeted interventions versus household targeted ones. For the latter, it may be possible to have a control

group while in community targeted interventions, it is difficult to establish a control group since everyone is expected to benefit.

Other considerations to make before deciding whether to use control groups include the feasibility of establishing homogeneity, costs involved vis-à-vis the budget, donor requirements, the scope of the intervention in terms of geographical stretch among others.

How to select a control group?

If using control groups, it is imperative to ensure that intervention's beneficiaries are **randomly** divided in two groups: treatment group (receiving intervention's assistance) and control group (not receiving intervention's assistance). The randomization can be done through Excel or Stata.

A control group needs to be **homogenous** to the population for

which the intervention is targeted. The only difference there can be between the two is that one receives assistance and the other does not.

A control group must be identified before the intervention is conducted

STEP-BY-STEP

1. Define your target population.
2. Select your sample population for your evaluation.
3. Through random assignment, divide your sample population into treatment and control groups.

Alternative to when control groups are not possible

Using control groups is not always possible or an appropriate option. In such cases, the next best approach is to use a **comparison group** comprising of people with very similar characteristics as a intervention's beneficiaries. For

example, if your project targets farmers living in 50 communities, your comparison group can be farmers living in communities which are not exposed to your intervention but have a very similar environment, agronomic practices, access to infrastructure, and other essential characteristics.

GIZ Impact Calculation Toolkit

The GIZ Impact Calculation Toolkit is the result of a joint effort between the Global project Rural Youth Employment (RYE), the Agribusiness Facility for Africa (ABF) and Competitive African Rice Initiative (CARI). It was realized in cooperation with the Sectoral department (FMB) - competence center for Rural Development and Food Security.

The GIZ Impact Calculation Toolkit enables users to profoundly assess impacts of agriculture and agricultural value chain projects. Project impact on **employment, income and production** in primary production arising from introduction of an innovation can be calculated.

Using reference data from other projects in the database or by adding other secondary data, the user can conduct **ex-ante assessments** assessing of potential project impacts. This allows to check impact assumptions and to undertake project economic analysis in project planning phases. By providing comparative overviews of different country-value chain-innovation combinations the tool can provide reference data when setting-up M&E systems. On the other hand, the tool can also assist in **ex-post analysis** to calculate project impact on employment, income and production, also with regards to BMZ 2030 standard indicators. The user can enter own project data or use best proxies from the available database.

The GIZ Impact Calculation toolkit can help **estimate effects** by providing potential reference values from other GIZ projects, as well as **measure effects** by providing impact calculations for employment and income. This is an ideal tool for those projects working in agriculture or with value chains.

The Impact Calculation Toolkit can be found [here](#).

Full-time equivalents (FTEs)

The full-time equivalent or FTE definition refers to the number of hours considered full-time. Generally, 1 FTE corresponds to 225 working days per year, each with 8 hours of working time.

FTE in the core topic 2 - Life without hunger – transformation of food systems (BMZ 2030 Standard Indicator 2.6):

In addition to increasing productivity, income and value creation, the **focus of agricultural development projects** is usually also on **reducing underemployment and creating additional jobs in rural areas**. In addition to recording employment effects in the processing, transport and trade of agricultural products, a special focus is placed on primary agricultural production. Since these are mostly informal, seasonal employment relationships and these can hardly be measured or counted, the recording of employment effects in primary agricultural production presents us with particular challenges.

Therefore, a unified **Calculation method for recording full-time equivalents in agricultural production** has been defined for rural development projects within GIZ (relevant for BMZ 2030 standard indicators).

Employment effects in primary production occur when trained smallholder farm managers apply good agricultural practices (GAP) or other innovations in primary production. For example, if they spend more time pruning, weeding and putting on fire belts, they invest additional work in their farms. **This additional work is converted into full-time job equivalent (annual work unit (AWU)) at 225 working days.** However, if it is a time-saving innovation, e.g. a mechanization innovation, the employment effect can also be negative.

Example: 500 persons worked an extra 50 working days (8 hours each), which corresponds to 111 FTEs (500 persons * 50 days / 225 days). 500 persons and 111 FTEs are therefore reported.

The recording of full-time equivalents is based on the annual work units, which are also common in the EU (see Eurostat 2021: Farmers and the agricultural labour force-statistics). The World Bank (see Jobs M&E Toolkit) and the Donor Committee for Enterprise Development standard (see Harmonized Indicators for Private Sector Development) also use full-time equivalents to measure effects on employment.

FTE in the core topic 3 - Sustainable economic development, training and employment (BMZ 2030 Standard Indicator 3.4):

If short-term/seasonal and part-time jobs make up a significant portion of jobs, they are converted into full-time equivalents wherever possible (1-to-1 match with the method employed by Harmonized Indicators for Private Sector Operations, HIPSO and Harmonized Indicators for Private Sector Development of the Donor Committee for Enterprise Development, DCED):

- 1) If there is a national definition of full-time equivalence, this is used as a basis for converting into full-time equivalents;
- 2) If there is no national definition for full-time equivalence, the figures of 225 working days a year at 8 working hours each (corresponds to 1,800 working hours/year) are used to convert into full-time equivalents;
- 3) If it is not possible to measure or estimate the extent to which a part-time/short-term/seasonal job corresponds to a full-time job with a reasonable amount of effort, the general rule is that a part-time job corresponds to half a full-time job, while short-term/seasonal jobs correspond to one full-time job.
